>From what I've heard, Chroma was a later addition.

My PAL machine (bought new in 1984) didn't have it, my motherboard has
"Revision C" printed on the back.

I added it myself yesterday. Just solder a 100K resistor to the

junction of R67,R68 resistors on the back of the board, and join it to
where the chroma pin of the monitor port is joined to the motherboard.

Easiest way is to solder the resistor to the wire first, then put
shrink-tube to insulate it. The addition should be made at the back
of the motherboard.

Some of the available Atari 8-bit video mods can be found here:

Hi Raphael,

thanks for your input. It's true the code is very unefficient. My general problem is that, I can't translate high level language to low level assembler steps. However, regarding my functionality I got another solution from a friend which looks like this:

```
x_new   dta 0

cursor_add_x .local
;       in:  x= mx (x-pos diff)

         txa
         clc
         adc cursor_x
         cmp Mod_max_x
         bcc _set        ; if smaller then set->
         cmp #-48
         ; if it's -48..-1 then set to 0
         ; I chose -48 because 48+160+48==256
         lda #0
         bcs _set
         ; else set to MOD_max_x
         lda Mod_max_x
         sub #1
_set
         sta cursor_x
         rts

         .endl cursor_add_x
```

---

this seems to work. However, now I considered a new problem. What if the value (mx) is bigger/smaller than 48? So what I tried now is to reduce the input value, so that the subroutine "cursor_add_x" works fine. So the idea is to do the following:

```
max = 48
mx = getMovement(); // between -127 and +127
```

```
if (mx>max)
     mx=max
else if (mx<(-max))
     mx=-max
save (mx)
---------------------------
```

I have serious problems to convert that to assembler. I playing around
the whole day now. Most problems do I have with that "else if". How can
it be translated?

Isn't "Pinhead" essentially Kickman?
Not an exact arcade conversion, but it's a great game.

I've added Day 2 photos to the bunch. I felt pretty under the weather
today, but still had fun. Someone offloaded a few more 2600 carts on me
(for a buck apeice), and I must say, California Games on the 2600 is
about the most technically impressive 2600 game I think I've ever seen!

Anyway, Day 2 photos:

  http://www.newbreedsoftware.com/bill/photos/vcf80/#day2

Enjoy!

Heh, hey, at least one guy I met flew out from New Jersey, so it can't
be _too_ far. (Of course, I'd prob. never go that far for such an event,
otherwise I'd be at all the cool 8-bit scene events in Europe ;))

BTW, my Day 2 photos (at the same page, just halfway down... I just posted
about them here) include some close-up views of the MyIDE boot-up screen
and A8JDPEG, since I knew folks would be curious. (I had some C=64 and
the Russian home computer guys asking me all sorts of questions :))

Enjoy!

Last-modified: March 25, 2005

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

   When I first got back into the Atari scene in 1998 after my Hiatis (since
like 1989), there was not much in the way of getting a hard drive, aside
from the older options...

ATR 8000 to MFM or IDE drive (ike!)
Black Box to IDE or SCSI drive.

    Now you have the MyIde drive setup as was mentioned above, which I and
MANY Atari users have. There are other interfaces, and don't forget the
virtual drive setup in the APE interfaces, which is actually what I and most
of use a lot more than anything. :)

    Doc Clu
    Atari 800 User

    Oh yeh... visit a good Atari BBS over telnet...

Unfortunately you can't derive any useful information on hard drive
interfaces when they are hooked to different drives.

As I understand it the problem is most modern IDE drives use huge
amounts of RAM and will automatically perform track buffering. They can
be programmed to mimic several different configurations, [heads, tracks,
sectors]. So for reads and writes it can end up that all you are doing
is essentially reading from a track buffer/ramdisk. Unless of course you
happen to hit upon a sector that is outside of that track in which case
another track is read in/buffered.

Only valid test would be with identical drives on different interfaces
and even that could have some problems.

What happened to the sio2ide interface on the imported pages (i had to bring
up the pages via waybackmachine)? That interface really intriuged me.

I really am looking for something that is buildable internally into the
machine whereas the myide card is external.

If it really doesn't matter, then I will go with the myide though. I just like the idea of having the hard drive built into my 1200xl without me having to swap cartridges.

Now thats what I would like to see - maybe one of those 2.5" hard drives
or even a card?

I have a bunch of those 2.5 inch drives and a few spare cf cards also.

I found something that there is internal myide interfaces, i'm going to look
into that.

Are there any drawbacks to the MyIDE interface?

Thanks,
Bo

I don't have any cards, but I've got a 2.5 incher that was left over when
I upgraded my Falcon.

I thought I read something, but it looked like it was saying that only the
130XE was big enough?

Honestly, I don't know. I've never used one - just getting back into the
8bit scene after being away for quite some time.

"Bo S." <bobo_snyder@hotmail.com>:

>I found something that there is internal myide interfaces, i'm going to look
>into that.

You can certainly build it into your computer, and you can use a 2.5" drive
or a IDE to CF adapter. Many other people have done this.

>Are there any drawbacks to the MyIDE interface?

I would say that the only drawback is that you need a replacement operating
system to use it. Some of the other interfaces that are interfaced via the
PBI/ECI don't need a custom OS, but they will be more expensive to build
and more elaborate because they have to conform to the PBI interface/driver
specifications.

The other drawback that I can think of, is that you only can use 256 bytes
of every 512 sector on the IDE drive, since the MyIDE interface is only an
8-bit interface. Quite a few of the IDE projects for the 8-bit operate
this way though (cheaper, easier) and besides, how much storage space do

you want attached to your 8-bit?

Personally I have bought and developed some applications for the MyIDE
interface because it is inexpensive and not too complicated. I think
Sijmen has done a great job with it.

The version 4.x OS is going to be great once its released.

I wanted to contact Bob about the 800 memory upgrade on his website, but
his listed address is not accepting email. According to his site, he's in
Indianapolis too, so now I really want to track him down since he's local
to me!

Any info would be appreciated.

thanks

I've created a web page that will list the status of active ATARI computer
hardware projects. The
intent is to have one place we can go to find the status of 8-bit and ST(e)-
Falcon-TT active hardware
projects. Of course, this can only be successful if you provide me with
information. If you would like
your project listed, please contact me (remove obvious spam filter) with the
correct information and
current status. I will not list e-mail addresses unless requested; only web
pages. In addition, if I've
listed incorrect information or if you would like your project removed, please
contact me. The URL:
http://projectstatus.atari.org

You may also contact me through my home page at http://www.josephplace.com

Thanks, and stay ATARI!

Well what I am looking for is a means of having all my atari games that are
on floppies stored on the hard drive. Its mainly for little programing
(like in basic like i used to do 25 years ago, holy cow, 25 years!) and
games.

The only thing that I really want, is to be able to use my atari 1200xl
rather than an XE based machine and the internal kits look like they are for
XE based machines. I always loved the keyboard on my 1200xl. The xe based
machines seemt o have mushy tramiel designed crap for keyboards.

Will it also work in conjunction with the SIO2PC cables? I want to have a
means of transferring data from and to my main computers to my ataris and
floppys are just a bit too archaic these days.

I'm not worried about storage space on the hard drive. if you cut a 4 gig
in half, its still way plenty of storage for an old atari.

Not sure, but won't the TT-touch keyboard enhancements for the ST/Falcon
also work on the 65XE and 130XE keyboards as well? They actually do make
the keys a little better.

I did the Best Electronics "XE" Touch upgrade in a 130XE ages ago. Most
definitely an improvement!

The internal interface that is being sold via Mr.Atari's website will work
inside your 1200XL I believe (email the guy selling it to be sure) but last
I looked there were only instructions for mounting it in an XE.

>Will it also work in conjunction with the SIO2PC cables? I want to have a

It works great in conjunction with SIO2PC.

Assuming I don't ever plan to hook my 800xl up to a TV again, is there any
problem with simply removing the RF modulator? Can it just be desoldered
and pulled out? Would I need to reconnect the desoldered leads somewhere?

I'm thinking I might want that extra bit of space at some point...

Hi Slor!

Your connection will stay. As you know, even older TV-Sets have a RGB Socket (We call it here SCART).
The Antenna out on this oldies, I see it more as a last exit. With today TV-sets you don't really need it.

I don't know how it looks like in the 800XL. I have removed the HF Modulator-PCB in my Spectrum 48K.
Built in a (3 parts) small RF-Out. Now I can connect it to a Video-IN (Yellow sockkets), making already a far better picture than the Antenna out.
I have also found a RGB Out project. It takes directly Y, U, and V from the Videochip and makes a solid rock stable RGB Picture. Probably better, or at least as good, as a 800XL. But there is no place in the small speccy case ;-(....

I don't think you will get troubles, disconnecting the HF-Modulator.
The circuitry of the mighty 800 is not known to me, sorry. I have never been in need of :-), already everything.... Joystick, RGB-Out, DiskFloppy Connector... etc.

Probably the best 8bitter for all times. The first, but till the end the best (not mentioning the small gfx-stepups between the VCS2600 and the 800/VCS7800). But I think the 400/800 is not much younger than a VCS2600!??

In my case (Sinclair ZX-Spectrum) were two cables, going in the HF-Modulator Case. One Red (isolated), and one blank. These two should be disconnected.
In your case you could remove the whole Modulator Case, if so.

My best wishes to you...

Best Regards,

Daniel Mandic

Hi JR, Rick-

Thanks for the replies and link. Yes, I agree, Rick, but I still find
the AtariAge data quite interesting. But your point about needing
common drives is well-taken.

Here's where I'm coming from. My MIO & Seagate MFM Drive (ST-251)
seemed definitely slower than my then-new Black Box. Since the BB
read/translated 512-byte sectors and used a much more modern Conner
3-1/2" drive with a decent buffer + many more sectors per track, that
seemed logical. Many years passed, and I got a KMK-JZ interface and
ran it with several different 3-1/2" and 2-1/2" drives. It seemed a
little slower than the BB, but very acceptable. (It is a very nice
interface.) Then I got a MyIde, and it seemed a bit slower than the
KMK (using mostly the same mix of IDE drives.) Still, an excellent
interface for the very modest price. But I thought that it would be
nice to see some numbers, so the AtariAge thread is a really good start
for me.   (Incidently, I still remember the "WOW" almost 20 years ago
when I got my first MIO & HD set up, compared even to Warp/Ultra Speed
floppies.) -Larry

Whoa! This is spooky! I was just going to pose the same question!!!
Honestly!

The RF modulator on my 800XL has always been noisy and I wouldn't use
it anyway. Meanwhile, all the space on the rear panel could be useful
for my reset switch, headphone jack, and future OS selection switches.

I renewed my interest in the A8 about a year ago (after 16 years!).
Since then I've only seen one hard drive interface designed with the
1200XL in mind (though it's not exclusively for the 1200XL). That was
Bob Woolley's SmartIDE.

I badly want to build this project (for an 800XL) but it's too big for
a novice like me unless someone produces a PCB. See the Bob Woolley's
Atari Classic SmartIDE article here.

http://www.geocities.com/atarimods/index.html

Nathan Hartwell, of Magelair.com had been enhancing the design with a
16-bit variation and a PBI redesign but both projects seem to be works
in progresss or his notes aren't up to date.

   Don't forget that with the MyIde that you can use the space beyond the 160 meg that immediate accessable for disk images and even better... MOVIE images. You've seen what Mr Atari did as far as making the preview for the Matrix, Atari commercials, and TRON playable on the Atari 8-bit right? All that is stored in the hard drive beyond the regular space. ;)

    A reminder that the Euro-Chat will be going on what is roughly (and this is difficult since this is the time switch from Daylight Savings time over here this weekend) but around roughly 4-5 pm Geneva time or 10 am CST.

    Location is at telnet://www.atarinews.org

    If you need help getting in my AIM chat will be up. You can reach me at "Doctorclu" in AIM.

    Hope you can make it to the Atari chat tomorrow. :)

Hi there Daniel,

I read somewhere that the ZX Spectrum computer had digital video
output. That sounds like an advanced solution for an otherwise fairly
simple computer, but if the Speccy has 8 or is it 16 colours, all you
need is three or four positions for the binary encoded colour signal
on the expansion bus.

Now that I think about it, maybe the digital output not available on
all models of this home micro.

Anders

>Atari commercials, and TRON playable on the Atari 8-bit right? All that is
>stored in the hard drive beyond the regular space. ;)

Actually, the movies only use space at some arbitrary cylinder number. If you enable image space, then pretty much all of your hard drive is "used". If you don't enable image space, most of your hard drive is probably unused.

You can figure out how your hard drive is used and where to put image space pretty easily.

The very most partitions you can have with any of the current tools is 8 x 16MB partitions (although this may change in a future release of MyIDE Config, especially if I get feedback requesting it!) Find how many cylinders each 16MB partition will take up by multiplying the sectors by the heads. This is how many sectors per cylinder you will get.

63 sectors x 16 heads = 1008 sectors per cylinder.
65535 sectors / 1008 = 65.015, so 66 cylinders per 16MB partition.

8 x 66 cylinders = 528 cylinders.

So with a hard drive that has 16 heads and 63 sectors the very most you will use for partitions is 528 sectors. You could start you image space at cylinder 768 (must be a multiple of 256). Image space goes from the start cylinder to the last full 256 cylinders on the drive.

In the case of a hard drive with 5000 cylinders:

(5000 - 0x100) OR 0xFF = 0x12FF (or 4863).

Potentionally, space from 768 to 4863 will be used for images. Each image in our hypothetical case will take 2 cylinders (since we need 1040 sectors

for each image), so you could get 2047 images on this hard drive!

The interesting thing is that cylinders above the image space can also be
used for partitions. In this case, 5000-4863 = 137 cylinders or 138096
sectors. You can take that into account when trying to figure out where
you should start your image space.

The latest MyIDE Config program that I am about to release displays, in the
Utility screen, how many sectors above image space your hard drive has.

That was probably more information than you needed or wanted. :)

Hi Anders!

The HF is the only screen-output on the Spectrum.

Well, colors. The ULA generates the video-signal. She also makes the colors. (8 with Bright, makes 15 real and always the same resolution 256x192. No gr. xx as the ATARI)
So the only posibility to get a better picture, is via the backsided Interface Slot (Z80-Bus). There you have Y, U and V. With that you can make S-Video, Video, HF as well (you like to say RF) and RGB, which is probably the best. :-)

Digital video output? Even my IBM-PC with DVI Connectors do not have a digital out. You ought to take the digital video-signal at the CPU side ;-)

Kind Regards,

Daniel Mandic

Vintage Computer Festival 8.0
Saturday & Sunday, November 5-6
Computer History Museum
Mountain View, California
http://www.vintage.org/2005/main/

This is your complete VCF 8.0 event guide! Vintage Computer Festival 8.0 happens this coming Saturday and Sunday, November 5th and 6th, at the Computer History Museum in Mountain View, California.

The doors open at 9:30am each day. Speaker sessions begin at 10:00am and run until 2:00pm. The exhibit and marketplace open at 2:00pm and run until 6:00pm.

Admission is $12 per person per day for full event access, including the speakers, exhibits and marketplace, or $7 per person per day for exhibit and marketplace only (exhibit and marketplace open at 2:00pm each day). Parking is free, and kids 17 and under are admitted free of charge.

Homebrew Computer Club Retrospective

The VCF in conjunction with the DigiBarn Computer Museum is proud to present a 30th anniversary celebration of the founding of the Homebrew Computer Club, the legendary Silicon Valley institution that helped to launch the era of the personal computer. Bruce Damer of the DigiBarn Computer Museum will moderate this panel of former Homebrew members, including Steve Wozniak, Lee Felsenstein, Allen Baum, Len Shustek, Bob Lash and Michael Holley.

Join the panel as they recount their experiences and gab with the group as we feast on some yummy cake, courtesy of the DigiBarn:

   http://www.digibarn.org/

VCF 8.0 Speaker Schedule

The speaker schedule for VCF 8.0 is as follows:

Saturday, November 5

Time	Session Title	Speaker(s)
10:00am	Film Screening: The Future of Pinball	Greg Maletic
11:00am	IOCCC Award Presentation Ceremony	Landon Curt Noll
12:00pm	VCF Shenanigans	Sellam Ismail
1:00pm	Homebrew Computer Club Retrospective Join us in a celebration of the 30th anniversary of the founding of the Homebrew Computer Club. Moderated by Bruce Damer of the DigiBarn.	Steve Wozinak Lee Felsenstein Len Shustek Michael Holley Bob Lash Allen Baum

Sunday, November 6

Time	Session Title	Speaker(s)
10:00am	A History of the Smart Card	Jerry Svigals
11:00am	Yack 'N Hack: Computers Talk Back	Deborah Norling
12:00pm	A Personal Re-telling of Personal Computer Retailing	Dave Freeman
12:30pm	Nerd Trivia Challenge! Are you up to the Challenge? Hosted by Evan Koblentz, editor of the Computer Collector Newsletter	Evan Koblentz and three Uber Nerds vying for the prize!
1:00pm	In The Beginning: A BBS History Discussion A panel discussion to follow-up the screening of BBS Documentary on day one of the VCF. Moderated by director Jason Scott.	Christian Wirth Joe Russack Ernie Longmire

For complete details on this year's speaker series including session abstracts and speaker biographies, visit:

http://www.vintage.org/2005/main/speaker.php

Nerd Trivia Challenge

The Nerd Trivia Challenge is a trivia contest to test the knowledge of the most serious computer history buffs. Contestants are chosen from VCF attendees who qualify for play by taking a preliminary quiz upon arrival at the VCF on Saturday, November 5. Those applicants scoring highest on the preliminary quiz will be selected to compete in the Nerd Trivia Challenge on Sunday, November 6, at 12:30pm.

The Nerd Trivia Challenge is being hosted by Evan Koblentz, editor of the Computer Collector Newsletter:

http://news.computercollector.com

To participate in the Nerd Trivia Challenge, ask to take the NTC preliminary quiz when you arrive at the VCF registration desk.

Film Screenings

The VCF is proud to present the first ever public screening of a new documentary film titled "The Future of Pinball":

http://www.thefutureofpinball.com

The Future of Pinball is a new documentary on the recent history of the pinball industry. The showing is a beta version of the film and VCF attendees will have a chance to help direct the final cut based on the feedback they provide.

Be sure to catch director Greg Maletic's talk on Saturday, November 5, at 10:00am.

The VCF will also be reprising a screening of BBS Documentary:

http://www.bbsdocumentary.com

The screening will take place on Saturday, November 5, and the film will be shown in its entirety to all VCF attendees. On Sunday, November 6, join director Jason Scott and three of the subjects from the film at the BBS history panel at 1:00pm.

Tours and Excursions

Guided tours of the Computer History Museum Visible Storage collection will be conducted on Saturday, November 5, with Visible Storage open for self-guided tours on Sunday, November 6.

For those interested in touring the DigiBarn Computer Museum, curator Bruce Damer will lead an excursion into the Santa Cruz mountains that

will disembark from the VCF at 3:00pm.

Complete details and tour times are available on the VCF 8.0 website:

   http://www.vintage.org/2005/main/tours.php

Bring On The Exhibits!

Once again the VCF has attracted some rather fascinating exhibits.
Check out what we've got in store for VCF 8.0:

   http://www.vintage.org/2005/main/exhibit.php

We look forward to having you at the Vintage Computer Festival. I'll
see you there!

Best regards,

Sellam Ismail
Producer
Vintage Computer Festival

> Unfortunately you can't derive any useful information on hard drive

> interfaces when they are hooked to different drives.

This is partly true, yes.

At the other hand, IDE drives are generally very fast, so comparing different interfaces even with different drives attached you're effectively comparing the efficiency/reliability of the IDE driver code at the Atari side.

Differences in reading speed like between 14k/s and 36k/s (see the thread) may be caused by differences in the actual driver algorithm used combined with facilities the interface itself offers to the driver (e.g. additional internal buffers and the like).

But if some interface/drive combo goes down to 2k/s (yes, two kilobytes a second), then there's doubtlessly a serious problem inside the driver software itself.

KMK

I'm trying to get something straight here, so hopefully you guys can help...

Ok, so I have 2 800XLs sitting in front of me. The first one is the one I have had since it was new, my first computer, immortal beloved (maybe that's going a little too far). A while back I did the simplest hack I could find to add chroma output to the machine, which was to put a line from the resistor just above Q5 (can't read the resistor number) to the chroma lead on the output jack. Voila, a nice bright s-video picture that is better than the composite and enough to keep me happy without doing a major video mod.

Now, the second machine is one that has not been modified (at least for video), and much to my surprise it's showing a picture when hooked up via chroma/luma. It's not as bright as the other machine (even a slightly different hus), but it's certainly just as clear. If I hook up the same simple line as I did in the first machine, then it transitions to a brighter version of the display.

So, the question here is what is this second 800XL that already has some sort of chroma output in place? I have read about the "Freddie" models that came out late, but this machine does not have that chip. Is this a very early 800XL that came out before they decided to stop hooking up the chroma? I'm just curious since I never expected to run across one of these with unmodded chroma output.

Oh yeah, and they're both NTSC machines.

Thanks

Atari 'forgot' to connect Chroma to begin with, and nobody noticed or cared much because few if any people could use the monitor output.

S-video input only became commonplace long after the Atari had gone.

Towards the end of the 800XL era, it was re-engineered to connect chroma and to use the Freddie chip, presumably in that order from what you said.

AFAIK, the modulator - at least in XE series - has to do with the Composite Video signal. Removing the modulator you'll also remove the Composite Video out of the monitor connector. Apart of that, no problems.

Interesting. I would have guessed that the machine is older than my other
XL, but I could be wrong. I can't find a date of manufacture on it
anywhere like my other one. Is there anything telltale in the location of
manufacture? Those are different...

1) Check behind pin 4 (I think that's the right number)of the DIN
connector. If there is a trace leading backwards then Chroma is indeed
connected. If the pin is just an empty solder point then no
connection.,

2) If there is no trace then check your video cable. Perhaps it's been
modified to bridge the Composite and Chroma pins to make Composite
available on what should be the Chroma lead. That was the other cheap
fix, Composite + Luminence instead of full Chrominence + Luminence.
Produces better output than Composite alone plus you still get some
artifacting.

To be honest though, I've never heard of it being done at the cable
because back in those good old days we used RCA connectors (not S-Video
connectors) so one could simply plug in the Luminence lead and if the
Chrominence lead didn't work we plugged in the Composite lead into the
Chrominence input on the monitor.

OT: Was Commodore the only company producing CRTs with separate
Chrominence and Luminence inputs? I can't seem to remember.

I really don't like the idea of a dead computer so I want to try to figure
out what is wrong with one of my 1200xls. When I turn it on, I get a black
screen with some faint horizontal (short, like 1/4 inch wide) lines all over
the screen. They flicker for a bit then the screen just stays completely
black.

I tore the computer open and pulled all the chips and replaced them firmly
and i got the same behavior.

However I also got the computer to boot up and make the funny whrring noise
and then boot to the ATARI logo twice but as soon as I turned it off and
turned it back on, it went back to being flakey.

I can leave it off for a day and turn it back on and it won't work right
away.

Any ideas??

I don't think so. I think i have a couple of rca monitors that have both
chroma and luma inputs as well as standard composite.

Just had another old RAM chip go out so a bad DRAM will be high on my
list of possible things that went south.

One of my favorites guesses over the last 20 years has been galvanic
reaction. The dissimilar metals [copper, zinc, lead] set up the
equivalent of a galvanic cell at the connectors. A lot of people just
leave their busted computers on overnight and by the next day they are
healed.

That you are getting screen garbage and noise is good. That means at
most of your LSI chips like Pokey, GTIA, ANTIC, CPU, are trying to work.

Hmmm...
take a good multimeter and check all caps for leaking.... on off those caps
is dry..
and also take a big mag. glass and check solder points.... life time for
cheap
solder are 8 or max 10 years....

bye... Rodrigo..

Hello,

I posted earlier about 9 items I'm putting up for auction on ebay.

Here's a link to what's available so far:

http://tinyurl.com/ahtcd

The remainder will go on sale tomorrow at 7:00 pm PST. The above link
should still work.

Thanks for your interest.

Actually I did check that (the caps). None of them appear to be bad or
leaking.

I'm going to leave it on overnight to see if that helps it run again.

Man, dont' people know how to SNIPE!?

6.5 days left on the auction and there are already bidding wars on it.
Geeez.

Watch the item, don't bid on it until the last second and then it wil
prevent all sorts of bidding wars!

Well actually, let me amend that - I've got the board pulled down for a
couple of days - should be back up in a few. :-)

On my BBS, there is a ZIP file called "Exprsall.zip' which has a lot of the
old Express terminals on a large ATR file. SX may be included there. Use
the BBS URL below to telnet there. YOu can download with ymodem or
xmodem-1k.

Using 3.2d, I have had some problems with hard drives. I currently run 3.2g
(or f - I forget which) with virtually no problems on my
MIO->Adaptec4000->Seagate ST251 setup.

Subject: Introduction

Conventions

All commercial vendors, developers, publishers, and repair shops should be listed here. "Active" PD/freeware/shareware developers should also be listed. Persons or entities holding rights to products, but not selling or supporting them in any way, should NOT be listed here.

"Vendor" = Reseller of products produced by others. Types of products sold are given in categories: new hardware, used hardware, PD/freeware/shareware, (new) commercial software, used (commercial) software.

"Developer" = Producer of products. Titles of products produced by the developer are listed. No prices are given.

"Publisher" = Publishes a print or disk magazine, or a book. Complete subscription or ordering information should be given, including prices. Authorized online publishers of originally print or disk magazines are also listed. Online books are not listed.

"Repair Shop" = Can repair 8-bit Atari or related hardware devices. Be sure to make advance contact before sending anything to work on!

Entries are presented alphabetically by company name, or publication title. If no company name exists, a personal name is used. "See" references indicate complete information may be found under the given heading. "See also" references indicate closely-related information may be found under the given heading.

The month/year that vendor information was most recently fully verified is given at the "upper-right" of each entry.

Every entry must contain a valid postal address or web address.

No email addresses are listed due to spam consequences.

The following is from http://www.upu.int/irc/en/ (2004.03.27)

When one writes to a stranger and requests a reply, it is considered polite to enclose a self-addressed stamped envelope. This works well when both persons live in the same country. However, if they are from different countries, the enclosed postage stamp will not be valid.

This technical problem was solved in 1906 when the Universal Postal Union, during its Congress in Rome, introduced the International Reply Coupon service. International Reply Coupons (IRC) are exchangeable in all member countries for the minimum postage of a priority item or an unregistered airmail letter sent to a foreign country.

The UPU's International Bureau processes approximately six million coupons each year and takes care of all accounting aspects. Developed countries are the largest users. The International Bureau does not sell ICRs directly to customers; they must buy them from their local post office. Although they are not obliged to sell ICRs, it is mandatory for all Posts of the UPU member countries to exchange the coupons.

Verfications -> YOU!

This list is in a constant state of development, and comes with no guarantees. Information of this nature constantly ages; therefore, the information contained in this list is constantly updated. Please use the latest release of this list whenever possible!

Remember, the success of this list is dependent on YOU, the reader, to send me updates that correct errors that you find. If you use this list, please do your part in keeping it useful for everyone!

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

   I highly recommend the Boot Factory. Out of all the Atari BBS's it is the
most loyal and consistant. May that never change.

No. The only sources I have are Basic XL, Basic XE,
and of course, many versions of Mac/65.

Amazingly, Bill Wilkinson acqiured the original version
of Atari Basic in a similar way. This is why OSS was able
to sell it at the same time as Atari was selling their
Basic. Bill wanted to improve the original Atari Basic,
(I don't know if anyone remembers OSS's original offerings
were disk based versions with enhancements before they
started producing cartridges) but was not really required
to do so...

Seriously 1600X1200 photos?

That would take a day or 2 to load on dial up! :D

I still got a problem with someone that has an opportunity to find items
like that but have no respect other than stacking it on end and never
bothering with it again. (sniff)

SpartaDOS is stable. You probably experience some connection problems
between the drive and the computer (weak or dirty connections), or some
of the setup components is a bit damaged thus working ureliably.

KMK

I have a dedicated Dos computer that I use with a registered version of APE

for DOS. The DOS computer serves two functions: The peripherals for Atari8
and I have old DOS programs I like to use. I use a modified 1200XL and it is
a really nice setup. Ape is great software. Anyway,I still have a stand
alone Atari8 computer with Supra hard drive. I don't know why with the APE
setup and all but I do! I will clean up the connections when I go at it
again. After the last crash I have been hesitant.

hi all,
  does anyone here have a 1090XL expansion box? if so I was hoping to
get some photos of the inside. and possibly the IC numbers off those
in there as well. thanks for your help.

Ken

message news:tkr4f.186117$HN5.73347@biebel.telenet-ops.be...
  Hi there,

  I am selling my complete collection of computers (over 570 different =
ones).
  If you are interested in some computer(s) from my collection, just =
mail me
  at info AT fki DOT be (replace AT by @ and DOT by .) and I'll add you =
to
   the list of possible buyers.DO NOT MAIL ME BY RESPONDING TO THIS =
MESSAGE
  PLEASE!

   In max. 2 weeks time I will start a mailing list and everyone will be =
able
  to bid on SEPARATE computers.The exact procedure of the sale will then =
also
  be explained

  So...please don't mail me saying : I am interested in X and I want to =
know
  how much you want for it as I don't have prices set.

  As you can see from my 100% positive feedback on Ebay (member ChaosDM)
  this is not a scam, but a serious sale. I don't want to go through =
Ebay
  directly, because listing 570 different items
  separately would take AGES!

  Anyway...the list of the collection can be seen here :
  http://users.pandora.be/F-242/Computers.htm

  There are a LOT of very and ULTRA rare items in there

  For example :

  A GOLDEN C64 WITH COMMEMORATIVE PLAQUE!
  A LOT OF ARABIC MSx's
  A LOT OF RUSSIAN COMPUTERS
  ETC...

  Cheers,

I also have a few items on EBay:

    - Basic XL w/ manual & Toolkit manual
    - MAC/65 w/ manual & Toolkit manual
    - 6502 Assembly books & Mapping the Atari & Compute's Second Book &
reference sheet
    - off topic for this group, but WordUp for Atari ST
    - Ultra rare Atari Sikh head

    Check out the pics at:

http://search.ebay.com/_W0QQsassZlisamom777QQhtZ-1QQfrppZ50QQfsopZ1QQfsooZ1QQrdZ0?

thanks,
Mike

Includes the atr file in there as well.

It's just under 10 MB. It is high res .jpg scans of the cover and all the
pages.

Someone might want to make a mirror.

Someone might also want to do some ocr to create a text file or PDF version
of the manual.

I like the original scans :)

    there,

I am selling my complete collection of computers (over =
570=20
    different ones).
If you are interested in some computer(s) from =
my=20
    collection, just mail me
at info AT fki DOT be (replace AT by @ =
and DOT=20
    by .) and I'll add you to
 the list of possible buyers.DO =
NOT MAIL=20
    ME BY RESPONDING TO THIS MESSAGE
PLEASE!

 In max. 2 =
weeks=20
    time I will start a mailing list and everyone will be able
to bid =
on=20
    SEPARATE computers.The exact procedure of the sale will then =
also
be=20
    explained

So...please don't mail me saying : I am interested =
in X and=20
    I want to know
how much you want for it as I don't have prices=20
    set.

As you can see from my 100% positive feedback on Ebay =
(member=20
    ChaosDM)
this is not a scam, but a serious sale. I don't want to =
go=20
    through Ebay
directly, because listing 570 different =

```
items<BR>separately=20
    would take AGES!<BR><BR>Anyway...the list of the collection can be =
seen here=20

Ken,

Pictures of the inside of a 1090XL won't do you much good.  The 1090 itself
is just a case and a backplane board with card slots.  There might be a chip
or two that are just some TTL logic chips.  Most of the circuits for the
various devices intended for the 1090XL are on circuit cards that would plug
into the card slots (e.g. RS232 card, 64k RAM card, etc).

Here's about the best image I could find of the inside.
```

http://www.computer-history.org/Atari-1090xl.htm
http://www.atarimuseum.com/computers/8BITS/XL/xlperipherals/1090xl.html

As best as I can make out from the photograph U6 looks like it says 74ALS643, U7 and U4 look like 74ACT244. I'm not sure what U5 is. It could be another 244 chip. But they do mainly look like they are signal driver chips for the XL's pararllel bus connection to the 1090XL.

Good luck. Sorry couldn't help much more.

Glenn

What might be a better idea, if you are intending on making a 1090-alike device for the 8-bit, is to look into the project to connect IBM ISA adapter cards to the PBI. I believe the project was highlighted in MyAtari on-line magazine a couple of years ago, complete with schematics, theory, etc..

Just an idea.

Hello,

I can provide the original 4.1 megapixel photos shown at my site, www.computer-history.org , if that would help.

Nick

We're going to be down for a week or so while I have an upgrade done to
the Mega ST running the board gang. (I learned my lesson - soldering and I
don't mix! <grin>

Thanks everyone, and sorry for any inconvenience. I'll post messages once
we are back up. :-)

<grin> Nah, anybody else would probably be fine - its just me and my
lack of hand/eye co-ordination!

--
_/_/_/

did not generate the up/down bits properly.
- Fixed the light pen code generation.
- Fixed parts of the 65C02 emulation, zero page access was
not extending properly to page 1.
- Fixed a lot of compilation problems on 64 bit architectures,
special thanks goes to Alexander M[illegible]ller for helping me to
hunt down these bugs.
- Fixed the SDL detection in configure.
- Fixed the player generation logic again a bit, did not
support horizontal player splitting quite as it should.
- Improved the emulator handling of warnings, you can now
go back to the menu.
- Added emulation of 1050 internal diagnostic commands.
- Fixed SIO return codes for SIO bypass routines.

So long,
Thomas

So I signed up today to exhibit (once again) at the Vintage Computer Festival
in Mountain View, California. It's next month, November 5th & 6th at
the Computer History Museum.

I'll once again be bringing my Atari 800XL, Atari Lynxes, and I think
this year I'll bring my _old_, woodgrain Atari 2600. :^)

  http://www.vintage.org/

Wish me luck!

hi Glenn,

well, I am trying to get an idea of what was actually buffered. I
was reading that 1090xl.txt file and saw some pretty nice ideas in it.
not expandable is the biggest problems with the BlackBox, MIO, Supra
interfaces. and wow, your eyes are sure better then mine, I couldn't
make out any of them. thanks for the links and the help.

hi Shawn,
  I did give this idea some thought. maybe for some future tinkering I
may do that. the ISA bus is about as poorly supported now as Atari
1090XL :) PCI opens up a whole new can of worms. but I have been
keeping some old isa hw just for this.

I'll also bring at least some INFO about the FlashBack 2, if not an actual device. (Where can I get one? Amazon doesn't have 'em yet, it seems.)

I'm getting one from Walmart for Vidar Olavesen. They keep
pushing up the release date on them. Was supposed to be on

10/25/2005, which is today, but I haven't heard that they
shipped it yet.

Hello Micheal did you forget I sent you a picture of my American NTSC
65XE which includes an ECI port? I thought you were going to adjust
the FAQ to reflect this. If you need to see another picture or any
other info regarding the later revisions of the NTSC 65xe (which are
basically 130xe's with 64k memory) please feel free to ask

On November 1, 2005 I'll be putting some atari 8-bit items for sale on
e-bay. For a preview with pictures and contact information see
http://brookwoodtechnical.com/atarisale.html. I'll post again when the
auction goes live.

Thanks for your interest!

Xref: g2news1.google.com comp.sys.atari.8bit:2964

Okey dokey, a while back, Doc Clu (aka: Greg Goodwin), asked me to setup something so that Atari 8-bit users could resolve domain names on their Atari 8-bit so that they may telnet to Atari bbs' on the Internet. Well, I've done just that.

I have setup a Macintosh Quadra 700 with NetBSD 2.1_RC6, and it is currently online at this IP address: 24.57.165.180 *or* at this domain name: macsale.dyndns.org port 23

You may login as: guest with a password of: guest

To get an IP address from a domain name you would type the following at the prompt:

dnsquery hostname

Example:

To get the IP address for macsale.dyndns.org, you would type:

dnsquery macsale.dyndns.org

To which the Quadra 700 would respond:

```
;; ->>HEADER<<- opcode: QUERY, status: NOERROR, id: 36629
;; flags: qr rd ra; QUERY: 1, ANSWER: 1, AUTHORITY: 5, ADDITIONAL: 5
;;      macsale.dyndns.org, type = ANY, class = IN
macsale.dyndns.org.     1M IN A         24.57.165.180
dyndns.org.             13h52m55s IN NS  ns2.dyndns.org.
dyndns.org.             13h52m55s IN NS  ns3.dyndns.org.
dyndns.org.             13h52m55s IN NS  ns4.dyndns.org.
dyndns.org.             13h52m55s IN NS  ns5.dyndns.org.
dyndns.org.             13h52m55s IN NS  ns1.dyndns.org.
ns1.dyndns.org.         13h52m55s IN A  63.208.196.90
ns2.dyndns.org.         14h41m1s IN A   204.13.249.81
ns3.dyndns.org.         2h16m11s IN A   63.209.15.210
ns4.dyndns.org.         19h57m10s IN A  213.155.150.205
ns5.dyndns.org.         23h28m55s IN A  63.208.196.91
```

And there you have it. You can clearly see from the above that the IP address for macsale.dyndns.org is 24.57.165.180. Pretty simple, huh?

Anyway, feel free to screw around on this machine. You will start in the home directory for guest and you'll have to cd your way to other directories if you want to snoop around or play. There are some games in the /usr/games/ directory if you're so inclined. I find that playing Tetris over a telnet connection is kind of interesting.

If you'd like an account with a bunch more privileges, send me an email with your chosen username and password.

FamilyNet International Newsgate

   Wow! Hey how have things been for you? Been a while!

   Well, thanks for setting this up. You have the chat site running currently
as well?

   Doc Clu

> From: You <you@cogeco.ca>

> Okey dokey, a while back, Doc Clu (aka: Greg Goodwin), asked me to setup
> something so that Atari 8-bit users could resolve domain names on their
> Atari 8-bit so that they may telnet to Atari bbs' on the Internet.   Well,
> I've done just that.

> I have setup a Macintosh Quadra 700 with NetBSD 2.1_RC6, and it is currently
> online at this IP address: 24.57.165.180   *or*   at this domain
> name: macsale.dyndns.org   port 23

> You may login as: guest with a password of: guest

> To get an IP address from a domain name you would type the following at the
> prompt:

> dnsquery hostname

> Example:

> To get the IP address for macsale.dyndns.org, you would type:

> dnsquery macsale.dyndns.org

> To which the Quadra 700 would respond:

```
> ;; ->>HEADER<<- opcode: QUERY, status: NOERROR, id: 36629
> ;; flags: qr rd ra; QUERY: 1, ANSWER: 1, AUTHORITY: 5, ADDITIONAL: 5
> ;;      macsale.dyndns.org, type = ANY, class = IN
> macsale.dyndns.org.     1M IN A         24.57.165.180
> dyndns.org.             13h52m55s IN NS  ns2.dyndns.org.
> dyndns.org.             13h52m55s IN NS  ns3.dyndns.org.
> dyndns.org.             13h52m55s IN NS  ns4.dyndns.org.
> dyndns.org.             13h52m55s IN NS  ns5.dyndns.org.
> dyndns.org.             13h52m55s IN NS  ns1.dyndns.org.
> ns1.dyndns.org.         13h52m55s IN A  63.208.196.90
> ns2.dyndns.org.         14h41m1s IN A   204.13.249.81
> ns3.dyndns.org.         2h16m11s IN A   63.209.15.210
> ns4.dyndns.org.         19h57m10s IN A  213.155.150.205
> ns5.dyndns.org.         23h28m55s IN A  63.208.196.91
```

> And there you have it. You can clearly see from the above that the IP
> address for macsale.dyndns.org is 24.57.165.180. Pretty simple, huh?

Does anyone know if there are any bench marks for hard drives/systems
used with the Atari? I'd like to compare several systems -- which
probably means comparing "host versus host" more than anything. -Larry

Hi Larry,

Check out this thread for some comparisons between KMK/JZ IDE, MIO and
MyIDE. I'd be interested in seeing your results:

I refound my atari love about 5 years ago and started collecting atari stuff
again . I amassed a pretty good collection of non-rare stuff (no 1090xl or
1450xlds or anything like that but i did manage to get like 4 1200xls which
was my favorite system in the early 80's).

Anyway, in the last 3 years, I put it on the back burner because I was
renting a home and not owning and didn't have a place for it. Well recently
I bought a house and have been setting up all my atari stuff once again.

My question is this, what is the status of hard drives interfacing to the
8bit world of ataris? I have plenty of older 2 1/2 notebook hard drives and
I would love to mount one of those into one of my ataris but I'm not sure
where to start.

Take a look here: http://www.faqs.org/faqs/atari-8-bit/faq/section-24.html

I have a MyIDE, and there seem to be a number of other options. Welcome
back!

>basically 130xe's with 64k memory) please feel free to ask

Hi Kevin, yes, thanks for that.

What I forgot to do was feed the faq-server with the latest copy of the FAQ
list, dern it. This posting was the same version of the FAQ that was posted
two months ago.

I did the faq-server update just now, so the changes I made over the last two
months are guaranteed to show up two months from now in the next posting.

I revised section 1.7 like this:

Introduced in 1985 as a replacement for the 800XL, the 65XE is the low-end
version of the 130XE. The 65XE is nearly identical to the 800XL in features,

minus the PBI. Many European (PAL) 65XE's and some late-production North American (NTSC) 65XE's include the ECI port. All XE computers also include the FREDDIE memory management chip.

Normally boots with Atari BASIC (Revision C) enabled; Hold down [Option] on startup to boot without BASIC.

Thanks,

-Michael

MrBiggles <mrbiggles909@yahoo.com>:
>The fact is that one of the options is "The item is no longer for sale".
>This is broad enough to cover 'because the seller fears they will not
>get what they wanted for it'.
>A seller can decide to not sell their item FOR ANY REASON. Therefore, if
>they decide the item is no longer for sale because they fear it will not
>fetch an amount they want, then that is their right (as long as it's not
>12hrs before the end).

That particular reason is expressly forbidden by the eBay policy. I also
think that its highly dishonest, no matter what kind of auction you are
running.

Personally, I would never do it.

Perhaps it's better, if you are contemplating ending an auction early for
dishonest reasons such as not getting enough money for the items, that you
don't post about it on public newsgroups first.

What about if your dog pisses on the item after it's listed? How about
if you legitimately lose the item (some people are really that
disorganized).

Thanks. And I know I'm right, and I believe they are mostly not
sellers, but buyers who have been screwed over by this very policy
and simply don't like it. :o)

You don't know what you're talking about. At Pete posted earlier, ebay's
policies specifically forbid ending an auction early because it isn't
reaching the price expected. That's why they have reserve pricing.

Whether you can lie and end the auction for some other, bogus reason is
beside the point. Please tell us your ebay id so we can all never buy
anything from you.

Don't buy anything from any of these crooks. Bill post your ebay ID so
we know who to avoid.

My philosophy on Ebay is that I love getting good deals, and if someone
gets a good deal from me, I love giving good deals, too.

I have gotten some REAL great deals off Ebay, no doubt about it, and I
was really happy about it. And I know that when someone gets a good
deal from me that it is really making thier day, and that makes me
kinda happy as well to be able to provide that experience to someone.

Somebody who is only concerned with what they can get out of the deal
and not concerned at all about the time and effort of thier customers
is not someone I want to deal with: there are plenty of ebay sellers
who follow through no matter what - it is the sellers who need
customers, NOT the other way around. I'd have more respect for these
guys if they'd just decide how much they want and put a "buy it now" up
on it, or put in in an ebay store.

I did - that's why I decided you would benefit from being corrected. Arguing with you doesn't come into it - others are doing that, and making a far bigger fool of you than I would be inclined to.

Is your opinion of yourself so great that you feel the need to call everyone who disagrees with you "losers"? And when someone responds in kind, then the rules change for them but not for you?

Very poor.

D.

I have to agree with Dr. Smith here, (believe it or not), but he's dead
on (IMHO).

If you want $X.XX for it, than set a reserve. If you simply end it
early because you aren't happy with the price, then you are dishonest
and should be avoided.

Especially if, y'know, a few newsgroup posts ended up being submitted
as evidence. This whole thread has pretty much guaranteed that the
seller can't even put up a legal defense.

It's against the rules... Period... It's fraud. The principle of the
auction system is the gamble. The seller makes a gamble on the final
price. That's the fun of it. That's WHY ebay is popular!!! And it's
CLEARLY against their rules. You can end an auction early because your
dog pissed on the item or because you shot at it with a 9mm in a drunken
fit of rage... not because you don't like the way the $$$ are going.

Give it up...

Mark

I need the plastic top for a XMM801 Atari Printer.

Its dark plastic and covers the printer head and etc.

Also could use some Ribbions.

phantomm@bellsouth.net

I notice a lot of people don't like Reserve auctions.... I seen pinball
machines end at $150 with Reserve that you know are worth $600+ people just
kinda blow them off. I certainly would be scared starting at $9.99 though
(laughs).

I always start my auctions with bottom line of what I would like to get at
least what I paid for it.

And always try to be reasonable on shipping too... and I 'clean' everything!

The 'biggest' thing though is I take the time to take photos and be honest
with condition... that dude could make a killing if he took a couple weeks
off work and sorted through everything, clean it up and test it all.

Hmm let's see... make $200 on it (he will end it early for sure) or make
$2000 on it by putting some effort into it.

I dunno I kinda like making money (shrugs)

As soon as I get the shelves painted and clear coat on them. I will put some
photos up. It has been a lot of work hiding the wires for everything and
getting the shelves right (I suck at building things). It's like a
chromosome mix up before I was born. I can't build things and work on cars.

VastFear

> Whether you can lie and end the auction for some other, bogus reason is
> beside the point. Please tell us your ebay id so we can all never buy
> anything from you.

Oh ok sure... oh, wait... maybe not.

One of the legitimate reasons for ending an auction is "The item is no

longer for sale". The reason it is no longer for sale can be anything,
INCLUDING the possibility that it may not reach the seller's desired
target sale price. If I wanted to I could end an auction early because I
stubbed my toe, or wasted time explaining something to a dufus on
usenet. That is the key here... a seller can decide that an item is no
longer for sale FOR ANY REASON (as long as it's not in the last 12 hr
window).

not necessarily, you dont know the condition of the computers (Im guessing they arent in the best shape judging by how they are stored) by his own admission he's never tried most (if not all) of them, so many of t hem are prob just garbage and virtually worthless. Also it sound's like if you get a good deal he will prob take the best ones and keep them for himself (or sell/donate them elsewhere) and leave you with the junk.

It's definetly a gamble bidding on this auction.

> FIRST PLACE!!!!!

As others have noted, It's called a "Reserve Fee Avoidance" violation because the seller did not set a reserve (and thus did not pay the extra fee), but ended up treating the auction like a reserve auction. I see where it can be misunderstood to only apply if he was running a reserve auction, but it applies to non-reserve auctions. There is no need to end an auction early for reserve auctions, because either the price is met, or it is not. (Well, there is, if you state you are listing the item locally, and it sells before the uaction ends, but you wouldn't end the auction because you did not get the price you wanted, because that's the definition of a reserve price)

> YOU don't get it. You have to end outside of a 12 hour limit.
> There is no ending any auction within this 12 hour time-frame.
> Read the whole thing, not just the part you want to argue with
> me about.

I read the whole thing....

Actually, you CAN end the auction within the 12 hour mark. You can technically end the auction 1 second before the deadline. You just can't do it chronically.

Nonetheless, there is a huge difference between what eBay rules allow and being a good seller.

The seller has already note that if he does not get a "fair" price for the non-reserve auction, he will end it early. Technically, eBay will let him do it, unless someone complains to them about the auction.

I see a problem with the rules in this area, as the first mention of the rule states it can never be done, but right below, it gives the seller 11 times to do without incurring any investigation. It's hard to know which is correct. In any case, given how popular eBay is and the fact I see infractions committed on listings all the time, I'd say the seller will have no issues from eBay.

That said, I think the seller is acting in bad faith. Regardless of the rules of eBay, no one wants to bid on a non-reserve auction, only to see it cancelled at the last minute.

Do you believe the seller is acting in good faith by noting he will yank

the auction if he doesn't get a certain amount? It seems strange to so
actively defend the original sellers abuse of the eBay rules, as they
are written.

Jim

> their OS's idea of ASCII.

One thing to keep in mind is that, even though we now know that the C64
massively outsold any previous CBM computer, when it was first
introduced CBM would have been re-using what they had done before, and
would have wanted as much portability of Basic programs as possible
between different CBM computers.

Its normal for "early entries" into a market to do things in an
idiosyncratic and slightly cumbersome way ... after all, its experience
WITH their products that teaches us where the "rough edges" are.
PETSCII and going to upper/lower case by swapping the case of ASCII
upper case characters is a case in point. It obviously was not as big

a deal as a "rough edge" as the horrible keyboard on the IMB PC Junior,
which died a well-deserved early death.

When the early CBM computers were designed, a "soft terminal" that
worked similar to a VT52 was handy, and the VT52 did not handle
Backspace/Delete the same way as the (later) IMB PC.

You can run into similar issues today when porting character programs
from Win/DOS to run in the "linux" term in Linux.

I visit this group from time to time, so I apologize
if I'm seeing this message a little late.

It's been a _long_ time since I've reviewed the document
covering the sale of Mac/65 to ICD in the 1980's; it
would take a little digging to find it (I have a hunch
that it's the only surviving document of the sale).
What I sold to ICD was a _version_ of Mac/65 and its
name. I still retained the right to develop an assembler
for the Atari 6502 based computers (or any Atari computer,
or any computer based on any CPU), even using the same
code base. I could not call it Mac/65 or associate it
with ICD's Mac/65, etc. As I recall, ICD's focus was on
the name Mac/65 with the code base IP a secondary
consideration, and it was agreed that changes to the
code base yielded a product that was _not_ Mac/65.
An unusual and simple agreement (by today's standards),
but that's pretty much how it went down.

At the time, with the introduction of the Atari ST series,
we wanted to put all of our resources into the new products;
ICD seemed like a good new home for the 8-bit series.
At the time, none of us thought that the life of the products
would be so long!

Again, I may be fuzzy on the finer details, but there
were three of us independently negotiating with ICD:
myself for Mac/65, Bill Wilkinson (et. al.) for the
Basic's XL and XE, etc., and the author of Action!
I do not remember where or how Jim Dunion (author of DDT)
fit into this at the time. I don't remember if OSS
owned DDT outright, or was licensing it from Jim.

ICD wanted all of the products or none of the products,
so if any party was reluctant to sell, that would have
stopped the purchase of the other products. Sadly, we've

all lost touch with each other, and I haven't spoke with
Bill Wilkinson in well over a decade. The last I heard
was that he was living in Washington state.

I have not released any version of Mac/65 into the Public Domain.

Having said that, I don't really know which _versions_
of Mac/65 are actually out there. However, I ask that
any Copyright notices in these versions be preserved
as they were originally; but I can only speak to Mac/65
(Note, some versions of Mac/65 contain an integrated
version of Dunion's Debugging Tool which I do not have
any claim to).

I'm amazed that the Atari 6502 based computers are still
enjoyed by people today, some 25+ years later. Yet, I really
don't know why the Ataris have fared better than similar
computers of the same era.

> I have also reproduced the BASIC XL manual in PDF form and will be
> selling repro's of the PDF in printed format. Currently working on

>
> Corey
> 8-Bit Classics

I still have all of the original Mac/65 source and many
of its versions as cartridges. I also have all of
the Mac/65 sources for Basic XL and Basic XE, since I
was the principal maintainer of the products (except for the
new floating point package, which Bill Wilkinson wrote).
(Yes, Mac/65 built Basic XL and Basic XE on an Atari 800 with 48k.)
Someday, I'd like to do something with this stuff, because
I fear it may be lost to time and it's a unique piece of
computing history that should be preserved. But, I'm reluctant
to do _anything_ because of the uncertainty of who actually
owns the Basic XL and Basic XE (and DDT) Copyrights today.
Again, because I rarely get rid of _anything_, these are
probably the only surviving copies of the orginal source.

Heh. We got a new Sun Blade 1500 in one of our labs at work recently, with
a brand new install of Solaris 8. I logged in at the console, opened a
Terminal window, started typing a command, and needed to hit Backspace. On
the screen:

^H

Argh! ;-)

On the Commodore 64 (and Ataris as well, I presume), the values also
represented BASIC tokens. You could write some very strange looking yet
functional programs through careful use of PETSCII graphics embedded in the
program (Jim Butterfield is the master of this). Plus there's the famous
"Insert Mode" where you can do all kinds of bizarre things.

And there is yet another disconnect, with keyboard scan codes.   So to
expand on your example, you would press A (keyboard code 10), and an A
(ASCII 65) would appear, and appear in screen memory as value 1 (A). o_O

I doubt Lance Ringquist owns anything (copyrights, source, or
otherwise) because as my lawyer stated, he has yet to establish proof
of ownership. Last person I believed own such would have been Mike
Hohman. My efforts to contact Bill Wilkinson (OSS) or any members of
the original ICD Team (as well as Mike Hohman, FTe) have been
unsuccessful. Whatever hacks, mods, or cracks I (when I say I then I
speak for myself here but I'm sure everyone else will agree) apply to
any OSS, ICD, or FTe product, the relevant copyright information will
be left intact. It is not my intention (and I'm sure not the
intentions of others) to claim such products as my own. The only
reason I would need such source code from BASIC XL/XE, Action, MAC/65,
SpartaDOS, etc. would be to adapt it or modify it for my alternate O.S.
project and nothing more:

I have the 10 meg version. It is an original Supra drive and interface. I
have just dumped my Spartados fat system again. It seems that if I copy a
old or corrupted file to the hard drive I am taking a chance. I don't know
if it's my system or the Spartados fat is that fragile! It is annoying.
What do you think?

Thanks for the very interesting post! I love to read history of old
computer days like this.

Yes, all the versions that I carry have all said copyrights. You
would actually be surprised on the following these products have.
Mac/65 and Action! especially. The 8-Bit days seem to come and go,
but will live on forever if we let them. I am trying to help preserve
this as much as I can. If I step on toes, let me know and I will be
happy to remove products. I contact original copyright owners (when I
know how) and am willing to reimburse them for their hard work if they
would like me to.

Very interesting on the sale, you rarely see the option of being able
to keep source and redevelop to really recompete with the same product
that you sold (even in the 80's).

Great to see that you are still part of the community!

Corey

old or corrupted file to the hard drive I am taking a chance. I don't
know
if it's my system or the Spartados fat is that fragile! It is
annoying.
What do you think? <

I used to own a Supra interface -- bought it from ICD for $5 or $10 at one of the AtariFests. I did get all the docs and stuff from Bob Klaas' bulletin board, but don't think I ever actually ran it. Having said that, there are (at least) two potential problems you may be having. First, make sure that the contacts are clean on the XL and the interface. I mean *scrupulously* clean! IIRC, the Supra interface did not have gold contacts. I use Caig Laboratories "DeoxiT" -- best contact cleaner I've found. Then follow up if possible with a contact-enhancer. I now use Caig's "Pro Gold.". (Always follow the mfgr's instructions.) If you are using a ribbon cable, make sure it is in good shape and short. And that its contacts are likewise clean and tight. Second, I am a MyDos user who only occasionally uses Sparta (mostly SDX). But I did have some experience with disk versions of Sparta -- 3.2d? I likewise had problems with it on my HD, and read the same from other some other users. I went right back to MyDos, and have been there ever since -- with no HD problems. I'm suspect that newer versions do fine with HD's, but if you are using an older one, it's something to consider. -Larry

Please make a copy of it and burn it to several CDs! It would be great if
eventually the source code can either be turned over to the public domain,
or something is done with it for the Atari 8-bit community.

Thank you Vidar!

I was beginning to think I had imagined this game.
For years I've kept my eyes out for this game (off an on) on all of
the websites that catalogue these things, and I've never come across
so much as a reference to it. I remember it being reviewed in a local
hobbyist magazine when I was a teenager, and playing it via a
compilation diskette such as the one you've linked to here.

I'll see if I can get it added to some of the cataloguing efforts.

I hope you're archiving your collection. If you have such "unknown"
gems as this, who know what else you might have that has been "lost."

Thanks again!

RM

I've taken it offline for a bit. Not sure if I will put it back up anytime
soon as there doesn't seem to be any interest. 1 call every couple of days
is hard to justify it. Pity too, I really wanted to keep it running but it
just died.

I can give you a fuzzy update.

ICD's owner went through a divorce and for quite a while no products were available. AFAIK after the divorce was settled the 8-bit products were put up for sale.

Probably the two leading bidders were Mike Holman(FTE) and Bob Puff with Mike winning. The purchase was mostly rights and a pallet of ICD PR:Connections. No truckloads of MIOs, just rights and an occasional piece of undocumented code. There was enough there for Mike to update and make SDX carts and a slightly modified version of Action!

Mike distributed one of the disk based versions of SD and disk based MAC/65 with DDT as freeware. I think he still had some manuals and those he offered for sale. Anyway quite a few OSS products made it back into the pipeline.

Mike was in the process of developing some major modifications to the 8-bit when he ran out of gas, gas being time, money, and energy. You may be able to find some of the references to it on the web, 65816 processor, Mars board, that kind of stuff. Lots of FPGA and FLASH memory type of mods, in circuit programmible so you could do stuff like have built in BASIC XE and hot swap OS.

That's were we've been for the last decade. Newell came forward to say that Mike didn't complete the contract for his memory upgrades so he was now putting them into the public domain. Occasionally someone posts about how they are declaring all FTE products PD but it is mostly BS from people that are frustrated or clueless about intellectual property rights. AFAIK most rights worth having still reside with FTE.

The 8 bit scene has changed a lot. Used to be a lot of programming interest and "How do you...?" type hardwre and software questions and answers. Seems to be mostly about "Where can I find the XYZ game I played in grade school?" now. I hid the last of my hardware ~3 years ago when my S.O. went on a "Throw this crap away!!!" war path.

There is also the SIO2PC work done by Nick Kennedy and Steve Tucker. Betweem them they have just about eliminated the need for a hard drive or Happy with software and hardware running on everything from an 8088 DOS PC to Windows XP.

There's other stuff out there like IDE drive interfaces, USB interface, and FLASH cartridges for abandonware software. You can even put an Atari BBS online over the internet now with a simple cable and software.

There is even MAE editor/assembler by John Harris. I'm sorry to say I have never used it but it's reported to have features like full screen editor and be faster then MAC/65. I lost the faith and switched over to TASM on an MS DOS clone long before MAE came out.

Well, there WAS a 30-second lag between my post and the actual email.
You're just too fast for me. :)

And don't forget, every 5 years I pop up with "I'm gonna make this awesome new game!" and then never do. D'oh!

Fortunately, my wife understands Atari was my first love, so I get to keep it all set up in my office in our apartment. ;^)

And BTW, hi Rick!!!

I'm not sure this is the correct game but Atarimania.com has Galactic Adventures by Paul Murray published by SSI.

http://www.atarimania.com/detail_soft.php?MENU=8&VERSION_ID=2124

Works on my 800, 800XL, and Atari800Win Plus 4.0 (final). Well at least the game starts and I can save to disk (don't forget to format a blank ATR ahead of time, btw). I haven't really played beyond a few minutes.

BTW, I prefer multidisk games on the emulator. Rename your disks in sequence (e.g. name1.atr, name2.atr, name3.atr... or nameA.atr, nameB.atr, nameC.atr.., or any final numbers or letters in sequence, and you can toggle the image to drive D1: by pressing ALT + N (for Next Image). It's convenient to use the same sequencing for your data/game save ATRs. Write protect the program ATRs.

As for Hypnotic Land I'll also try to email it to you. Is the "OLA..." AT ONLINE dot NO the correct address?

Yes, that is the correct email address. Thanks. I did find Galactic
Adventures, at the site you mention, so you don't need to send that, but the
Hypnotic Land would be great. Thanks

Actually, all the files are on the way!

Hypnotic Land was compliments of a friend, from Holmes CD #3.

Enjoy.

My S.O. still loves your game Gem Drop; she plays the net version all
the time. Figure a baseball player that strikes out/gets out 70% of the
time still makes it to the Hall of Fame. So it should be for games.

Er, most of the surviving 8-bit and ST BBSs are now available by telnet.
No long distance calls. :-)

The problem is, we have to take your word for it. What I see in the
picture is a big pile of boxes and plastic bags. I see in Apple II
wedged in next to the bicycle, and I think I can see two Apple II era
monitors. We all know what it takes to store such items, but when it
comes to buying something we need some assurances. This is clearly a
huge pile of stuff, but I see nothing in the picture I want to own.
Furthermore, you make no assurances regarding physical condition, or if
any of it actually works. You even admit in the description that you
don't know everything that you have stuffed in there.

You probably will not get a bid anywhere near the market value of all
this stuff, because your buyers cannot get a clear idea of what you
have for sale. Besides, if you really want to get top dollar for this,

break it up into bundles. Hell, you could probably get enough for the Apple II and the two monitors (assuming they work and you clean them up real nice) by themselves to pay for another month's rent on the storage unit, which would in turn allow you to dig into the first layer of boxes and put together a few more bundles. It's a huge job, but I think you'd be happy with the extra cash. That is, unless everything is in such bad condition (or simply non-working) that such close scrutiny by your bidders would be counter productive.

Dude, most of us here are just trying to be helpful, sure it's critisim but no one here (except for one poster) thinks your auction is bogus. Just that we could see you could do better if you had a better presentation is all.

I wish you luck on the auction, certainly it's a lot of cool stuff you
have listed.

Sure I know what most of the items you list in your auction look like,
but without pictures how can I know what condition they are in? I
would pay alot for mint condition Atari 800xl's and Apple II's but
hardly anything if they are in poor condition.

Surely bidders are going to consider the "Sight Unseen" factor,
and the "work involved" factor as well, but, the "what-if" part
is intriguing, even to me, but I'm in PA so this is out of the
question for me entirely anyway. Had I been in the local area and
possess the space to store this stuff, I'd consider bidding and
should the list even remotely describe what "is" there, it truly
could be the Gold Mine that is being offered. The person who is
auctioning off this stuff, however, is inveritibly, "The Loser".
Broken down and sold in separate lots surely would bring loads
of cash, but this way, it is just a garage sale at best. :o)

Looks kind of like "Contiki" for the C64 and Apple II.

As a collector (of a quite a large amount of vintage computers and game systems) I think its 'BLASPHEMY' to treat your collection like this and just stack and pile it to the ceiling with no rhyme or reason!

One has no respect at all if they treat their prized collection like this.

Still would be cool to go through... feel sorry for whats on the bottom though (sigh)

I wish I had that much money where I could just not care and sell everything in one huge pile on eBay. People don't realise if took the type and tested and took photos of everything that one could make a killing on eBay instead

of a bulk deal for stuff.

I will cherish that photo though thats funny but sad give the collection to me... I will air it out and add it my 'shrine' of gaming.

VastFear

I was a compulsive hoarder, I bought most everything I came into
contact with thinking it was going to be valuable/needed/useful
someday. I (foolishly) envisioned that I could save this stuff until I
retired and then it would be the basis for a hobby. I rarely if ever
tested what I bought; I figured I would do that as my hobby. If
something didn't work I would (and do) have multiple examples from
which I could get parts. I assume most of the stuff I bought worked; I
have no reason to believe it doesn't. I assume some of the stuff has
problems. The collection is obviously being sold as is, like I said if
something doesn't work there is a good chance there is another
example that does. There is a reason I am selling it the way I am, I do
not have the time or the resources to break the collection down and
sell it bit by bit over eBay - THERE IS TOO MUCH! If I don't get a
reasonable offer I will donate the majority for a tax write-off and
keep only the cream of the crop. A lot of people seem to be taking this
personally. Don't, it doesn't involve you. This auction is not for
everyone. It takes a large commitment (I pay $100 dollars a month to
store it) and most people will not be in a position to handle it. As
far as having to take my word for it, I imagine you've noticed
that's how eBay works; a lot of it is on faith. Once again (If you
read the full description) you'll notice I referenced my feedback
(much of it gained from buying stuff in the collection), it is
impeccable. Tomorrow I will go out there and rip some packages open and
take some pictures, I don't think this is really going to give much
insight into the vast majority of the collection, but it's what the
people want. Please know that I do appreciate the constructive
criticism, it's the ignorant blowhards I could do without.

S:-)

Um, does this mean you plan to renig on your auction if you don't like the
final price? You did not set a reserve.

You listed with no reserve and you have a bid - you don't get to keep or
donate anything.

>..... my feedback (much of it gained from buying stuff in the collection), it is
> impeccable.

won't be for long if you reneg on your auction.

Oh so now you will decide depending on the winning bid what the person
gets? This doesnt sound right at all.   Personally I would stay away
from your auction.

I am not legally obligated to give away for next to nothing something I
have thousands of dollars and years of effort sunk into. If I was to
end my auction early (emphasis on my, it's meant to serve my purposes,
I'm the paying customer), I would be well within eBays rules
(http://pages.ebay.com/help/sell/policies.html). They are only
concerned with "Chronically" ending items early. If I were to do
it, it would be the first time ever. S:-)

I grew up initially with several computers in the Atari 8-bit series.
After my 130XE died, I got my grandfather's Commodore 64. They had
one thing in common: wacky dissociation between screen memory and
their OS's idea of ASCII.

With both computers, you could display letters on the screen with a
POKE to video memory. However, the number you POKEd was almost never
the same number you would put into a CHR$ function to print that
character.

For example, to get an uppercase A, you would:
   (a) PRINT CHR$(65)   (assuming uppercase mode if C64)
   (b) POKE 1024,1   (Commodore 64)
   (c) POKE 40000,33   (48k Atari 8-bit)

Is there any reason the screen memory was set up this way? Why wouldn't all three
be 65?

Also, what's the deal with the backspace? In PETSCII, it's CHR$(20),
even though CHR$(8) is right there doing nothing. In ATASCII, it's
CHR$(126). I understand that ATASCII puts graphics tiles in its
first 27 characters, so it can't use CHR$(8) for backspace or
CHR$(13) for CR. But ASCII DEL, at CHR$(127), is RIGHT NEXT DOOR,
but ATASCII puts the tab there instead.

There's one peculiarity that's specific to the Commodore 64. It
seems that PETSCII allocates graphics characters nearly at random.
For example, the ASCII values of C=A, C=B and C=C are 176, 191 and
118, respectively. The color control codes are even more haphazard.
If I ever want to use the CHR$ function or a hex number to specify
one of those graphics characters, you pretty much have to look it
up every time. Is there a pattern I'm not seeing?

I wonder if there's any hidden wisdom behind these decisions.

Heh. Try the Apple][(where, thankfully, it's much simpler)...

]? chr$(65)
A

]poke 1024,193

]

At least it's as easy as adding a 128 on the Apple.

Thankfully on the Apple it's 127. (8 is Left Arrow, which made keyboard
handling a nightmare in the original Dapple. 9 is of course Tab. Apple
used ASCII quite straightforwardly in their computers, thank God.)

This is directly from eBay seller policies.

Ending Your Listing Early

Sometimes something goes wrong and you can't complete your listing as planned. If needed, you can choose to end your listing before the scheduled date. If there are bids on your item, you can cancel them.

Reasons for ending listings early include:
Note: Your account will still be charged listing fees (such as the Insertion Fee) if you end your listing early. Consider revising your listing first if there are aspects of it you want to change or improve.

  a.. The item is no longer available for sale.
  b.. There was an error in the starting price or reserve amount.
  c.. There was an error in the listing.
  d.. The item was lost or broken.

Timing Matters
When there are 12 hours or fewer remaining and the item has a winning bid, including a reserve met bid, sellers may not make any changes to the listing, including:
  a.. ending the item early. Sellers may cancel bids, but not end the item unless the item is being sold to the high bidder
  b.. adding to or changing the item description
  c.. converting the item to pre-approved bidder

Canceling bids or making changes to a listing with bids when there are 12 hours or fewer remaining damages the buyer experience and can undermine trust in the marketplace.
To end your listing early, follow these steps:

  1.. Type your item number into the End My Listing Early form. (You can get this number on your listing, on your confirmation email, or on your My eBay page.)
  2.. If there are bids on your item, choose between:
     a. Cancel bids and end listing early
  or
     b. Sell item to high bidder(s) and end listing early
  If your item has no bids, you'll skip this step.
  3.. Choose the reason you're ending your listing early.
  4.. Now your listing will end and will no longer be displayed on eBay. If

there were bidders, they will be emailed that their bid was canceled and the listing ended early.
Note: Sellers are not permitted to cancel bids and end listings early in order to avoid selling an item that did not meet the desired sale price. This is considered to be reserve fee circumvention. Although there are legitimate reasons for ending a listing early, abuse of this option will be investigated.

Not according to what you posted:

/Note: Sellers are not permitted to cancel bids and end listings early in order to avoid selling an item that did not meet the desired sale price. This is considered to be reserve fee circumvention. Although there are legitimate reasons for ending a listing early, abuse of this option will be investigated./

That means that since the seller indicated in this thread that they intend to end the auction early if they do not receive a "worthy" bid, which implicitly is a circumvention of the reserve fee, thus an abuse of the end-early option.

Actually, if you don't set a Reserve Price and you don't end the auction
early, you ARE legally obligated
to sell to the highest bidder. Just as making a bid constitutes a contract,
so does offering an item for sale.
If I were you, I'd end the auction early and re-list with a Reserve Price.
As it stands, if the winner of the current auction wanted to take the case
to court, you'd be on very shaky legal ground.

> I wonder if there's any hidden wisdom behind these decisions.

Yes, the wisdom is called 'copyright'. People were making a career out of sueing each other over copyright infringements in those days. So lots of companies did it a little different.

These days we have a thing called 'software patent', which leads to exactly the same thing.

Except that the lawsuits are a lot more expensive.

I wish I chose to be a lawyer. Nothing better to make money off than two people fighting each other.

>all three be 65?
>

  I imagine that it's because a value read from screen memory is used
directly by the hardware as an index into the table that contains
character shape definitions. The ASCII charcter set may not be the
best choice for this--for one, you need to deal with all those non-
printing characters. Such complexity may have added unacceptably to
the cost of the hardware, while doing translation on software was
essentially free.

>Also, what's the deal with the backspace?

  Well, remember that even "real" computers couldn't get DEL and BS
straight!

Read, it says "DESIRED SALE PRICE" and "RESERVE FEE CIRCUMVENTION".
This applies to auctions with a reserve fee set. He has none set.

> That means that since the seller indicated in this thread that they intend
> to end the auction early if they do not receive a "worthy" bid, which

Here you eat your own words, where you repeat the same terms,
"CIRCUMVENTION", and "RESERVE FEE".

He may end his auction at any time before the 12 hour to end limit.
You pulled your data out of context, and I've been a seller on eBay
for quite a while, so read up.

Bill Garber

You know, this has been one hell of a learning experience for me... All the nonsense I fought with was 100% due to my complete lack of experience with Linux. Allow me to explain...

I had all but given up on ever using my Linux server to host files for my trusty old 8-bit, and I would have never figured out what was going on were it not for Doom 3.

A buddy of mine finally talked me into getting Doom 3 as he and all my other friends have been playing it for quite some time. I played it online a few times and decided my buddies and I needed a server of our own not full of guys with "1337 mad skillz", and I had the perfect platform and connection to do it with. So I downloaded and installed the Doom 3 Linux binaries and set up the server. Worked great. Then I decided I wanted to actually try to play the game on the Linux machine just to see what it's performance was like.

Well, Doom 3 needed the newest nVidia driver and I never installed one, it was still using the generic one that came with the distribution. So I download the driver installer and it said there wasn't a precompiled driver available for my kernel and it tried to build one for it. That was where things got stupid.

It found my kernel source headers, but kept refusing to compile it, but wouldn't give me a good reason why. I dug around for 4 hours trying to find the problem, checked all the logs, and found nothing. I went back to check my kernel source and it was there, just fine (or so I thought). "uname -r" returned "2.6.11-6mdk", but my headers were "2.6-2.6.11-12mdk" (what the Hell does that mean anyways?!)!

I discovered that "urpmi" kept fetching the "12mdk" instead of the "6mdk". I have no idea why it did this, but, in the end, rpmdrake got the "6mdk" I needed.

The driver compiled nicely and I was in business (after I fixed the minor disaster I caused to the X server...), away I went fragging demons using penguin power.

Couple of minutes into the game, I had an epiphany. Closed down my game and tried to compile and install atariserver again, and this time it worked FLAWLESSLY.

I really want to thank Matthias for his patience in dealing with my
stupidity, and I'm loving AtariSIO so far. :)

Thanks again guys,
--

Hi there,

I am selling my complete collection of computers (over 570 different =

ones).
If you are interested in some computer(s) from my collection, just mail =
me
at info AT fki DOT be (replace AT by @ and DOT by .) and I'll add you to
 the list of possible buyers.DO NOT MAIL ME BY RESPONDING TO THIS =
MESSAGE
PLEASE!

 In max. 2 weeks time I will start a mailing list and everyone will be =
able
to bid on SEPARATE computers.The exact procedure of the sale will then =
also
be explained

So...please don't mail me saying : I am interested in X and I want to =
know
how much you want for it as I don't have prices set.

As you can see from my 100% positive feedback on Ebay (member ChaosDM)
this is not a scam, but a serious sale. I don't want to go through Ebay
directly, because listing 570 different items
separately would take AGES!

Anyway...the list of the collection can be seen here :
http://users.pandora.be/F-242/Computers.htm

There are a LOT of very and ULTRA rare items in there

For example :

A GOLDEN C64 WITH COMMEMORATIVE PLAQUE!
A LOT OF ARABIC MSx's
A LOT OF RUSSIAN COMPUTERS
ETC...

Cheers,
Dimitri Kokken
Belgium

On the TI-99/4A, you add 96 (>60). This is called the BASIC offset, and is used to maximize VDP memory for your program. (The beginning of the character pattern table overlays another area).

So:

```
>PRINT CHR$(65)
A
>CALL POKEV(0,161) ! place A at screen location 0 (and POKEV requires E/A or
Minimem or an enhanced XB)
```

As far as backspace, the "left arrow" key is 8, and you can hit FCTN-V for 127. Or you can change the keyboard to PASCAL mode (mode 4) and then Ctrl-H is 8, and 127 is still FCTN-V.

But as far as ASCII goes, outside of the BASIC offset, it is quite straightforward. Except that on the TI control characters don't get translated (meaning control characters in files are read just as they are, don't do strange things, control characters printed to the screen don't cause screen clears, beeps, or anything else - they just show whatever the character definition for that character).

```

I too have been a seller on eBay for quite a while, and I feel my
interpretation is correct. The term "reserve fee circumvention" means
he did not use a reserve, thus circumventing the reserve fee that eBay
charges. The policy stated is their to protect eBay's fee structure,
not the seller nor the buyer.

Please read ALL of the policies on ending early, not just
the areas you need to argue with me. It says, should the
seller end early, the eBay listing fees will still apply.

'Nuff said, say n'more, nudge-nudge, know what I mean?

End of discussion, because I know what I'm talking about.

I'm intrigued as well and in Philadelphia. Maybe we should make a drive?
I definitely do NOT have the space right now, but I plan to buy a house
within a year which will have a suitable basement for this pile ;) I
worry about renting a truck and getting there and it just being completely

worthless junk. I think we all know some collections are like magic,
others are a pile of half broken 520ST's. I'd pay more for a single
clean falcon than 15 dirty 520's. That's why the contents matters to me,
and while this is intriguing enough to look at, I won't make the drive on
that description alone.

Thanks,
Mark

Doh!

Nevermind, the collection is in Portland. I thought Massachusetts for
some reason. My ownership of this collection is now completely out of the
question ;)

Thanks,
Mark

This is the correct interpretation- if you end your auction early by
cancelling all the bids and ending it, you essentially created a reserve
auction without paying for it. That is what eBay doesn't want because
it damages the marketplace. Nobody will bid on things if they knew the
carpet will just be pulled out if it looks like they are going to get a
good deal.

If you want more money for your good, then set the reserve, or else just
set the minimum bid amount for the least amount you would take for it.
  If you put it up for a dollar and later pull the auction, you are a
jerk and I would report you if you did it.

Ebay has a lot of screwed up rules that they continue to use that make
no sense, and really this is still actually too easy to do- you should
not be able to end your auction *at all* in my opinion.

Pete

No, you don't because he didn't pay the reserve fee.

I'm not arguing with you. It says you can end any auction
outside the 12 hour limit, by choosing one of 4 options
for doing so, but you still pay the listing fees for the
auction type you chose. Difference is with a reserve price,
if it ends naturally you can still choose NOT to sell to
any of the bidders. Now go away. Thank you.

Bill Garber

What was discussed here is clearly mentioned in the rules as "Reserve
Fee Circumvention" and is a reason to report the seller. I don't
understand how it could be more clear.

http://pages.ebay.com/help/policies/listing-circumventing.html

Pete

It actually calls it "Reserve Fee Avoidance", not Circumvention, but
same thing.

-snip-

Reserve Fee Avoidance - Canceling bids and ending a listing early
because the seller's desired price has not been met.

-snip-

LLLLLLLLLLLLLLosers!!!!!. Listen closely. HE DOES NOT HAVE A
RESERVE PRICE SET, SO, HOW CAN HE AVOID A RESERVE FEE IN THE
FIRST PLACE!!!!!

Hey loser, listen closely.

If I set up an auction, I can decide not to have a "reserve". This saves me some money, as adding a reserve costs me a little more to list.

So I list with no reserve. However, I'd quite like to get about £100 for this item. With one hour to go, the bidding is at £50 and has been static for a while. I'm not going to get what I had hoped for this item.

So I cancel the auction.

This is exactly what would happen if I *had* set a reserve, but because I did not set one then Ebay loses out on that small amount of extra cash they would have charged me. This way, I get an auction that works the same way as a reserve, but without paying.

Ebay doesn't like that, so it's against the rules.

Oh, I forgot to add five exclamation marks, but I think you get the point.

D.

I do believe he's saying your clueless. And I tend to agree. Payton's
correct in his reading of the policy.

You argued your own point, so clearly you don't understand the whole
concept of this at all. He didn't pay the reserve fee, so he IS
"avoiding" it. You pay an extra reserve fee when you list your item, so
it's a little more expensive to do so. If you end your auction early
because you don't like what it's selling for (which is a selling offense
you can be reported for) then you just created a situation that has the
same outcome as the reserve auction, BUT YOU DIDN'T PAY THE FEE!

Pete

YOU don't get it. You have to end outside of a 12 hour limit.
There is no ending any auction within this 12 hour time-frame.
Read the whole thing, not just the part you want to argue with
me about.

Yes I agree 100% this guy is playing around a bit with the rules and
he admits he doesnt even know what stuff works and what doesnt, it's
probably mostly in pretty poor shape, and even if you won the auction
would you trust this guy not to take the best stuff out before you
came to pick it up?   I know I wouldnt.

I dont think he is gonna have much luck.

Haha. Read this again, slowly. You should stop, Bill. You're not only showing that you don't understand eBay rules, you're starting to look like an idiot, too.

The last 12 hours has NOTHING to do with this discussion. You can't end
an auction for the reason this whole thread is about, last 12 hours or not.

Again, from their Policies:

"Note: Sellers are not permitted to cancel bids and end listings early
in order to avoid selling an item that did not meet the desired sale
price. This is considered to be reserve fee circumvention. Although
there are legitimate reasons for ending a listing early, abuse of this
option will be investigated."

I mean, damn. What is your eBay user id?

The fact is that one of the options is "The item is no longer for sale".
This is broad enough to cover 'because the seller fears they will not
get what they wanted for it'.
A seller can decide to not sell their item FOR ANY REASON. Therefore, if
they decide the item is no longer for sale because they fear it will not
fetch an amount they want, then that is their right (as long as it's not
12hrs before the end).

nickb@eris.io.com (Nick Bensema):

>I wonder if there's any hidden wisdom behind these decisions.

At least on the Atari, I seem to recall it had to do with the fact that in
some graphics modes (gr.1, gr.2) you could display text in color. The
color was based on the most significant bits of the character screen code.
You could do something like:

```
print #6, "UPPERCASE"
print #6, "lowercase"
print #6, "INVERSE UPPERCASE"
print #6, "inverse lowercase"
```

and get different colors for each line of text. This dictated the layout
of the character sets to a large degree.

I doubt it had anything to do with intellectual property rights in any way.

Ahh, Yes. DOS 2.5 can't do a large ATR. You need
SpartaDOS, maybe MyDOS, or a boot loader image.
FLIPANDFLOP is legal, it is 8+3, you just don't see
the FLIPANDF.LOP the period. I don't think any DOS
does more than 8+3. Many game files can't load from DOS,
therefore, you need a menu or boot loader image.

For David and others wanting to diy upgrades on their Atari 130xe computer, follow the link http://www.textfiles.com/magazines/ZNET/0041.txt. This is an old zmag text file of how to do it. I have personally performed the Peterson upgrade and found it to be very reliable as long as you keep your soldering puddles under control. It may get tedious at times unsoldering/resoldering so dont rush the effort. Take your time on each and every chip and follow instructions exactly as shown. Hope you find this useful.

Howdy Rick, folks

> Just as a for instance, you would want an XE adaptor *IF* you had a MIO.

I never had a MIO, but I ordered an XE adaptor way back when I needed some cables for my 850. I now use it with my BlackBox. That way, I have a flexible connection between by BlackBox and my XE. This makes it easier to move the XE around a little without damaging the traces/connector.

Check out: http://www.holyoak.com/atari/8bitcomp.html (first 2 links
below computers) and http://www.myatari.net/issues/may2001/memory.htm

I'm not finished yet, the week Phi2 signal in some XE's is causing
problems with some 8 bit Atari computers. But you don't loose anything.

You have a very good argument. I have a Supra hard drive interface and do use it with an 800XL. An adaptor would just enable me to switch to an XE (if I wished). I just wondered if there was any around. Without damage they should last a very long time (unlike the peripherals that used it). Thanks Mike.

Slick! That one looks to be about the easiest one to do. I'll have to look
into doing that when I have some spare time. Been way too busy at work
lately.

Hm... That looks very tempting, but appears to be somewhat risky. If I had
another 130XE to just screw around with, I'd give it a whirl. When it gets
to a point beyond the beta stage, I may try it.

For the time being, I may buy another one for expierementation. I found one in a used electronics/computer store about a week ago for 10 bucks. No cables, and in unknown condition. But for 10 bucks, it'd make a good donor machine at least.

Bill,
   Congratulations. Between this and the games I see all the time on the Knoppix discs with your name, I think I am going to have to request an autograph. The game looks really cool. Great work with the networking portion. I'll be attempting to get it to my phone here asap.
Thanks and keep us posted on your next creation,
Isaac Davis

I located a copy of moviemaker.atr, but it is the 130K XL version. I
just made an image of some movie files I made 20 years ago, but my
Movie Maker disks are corrupted. Does anyone know where I can get or
buy a working copy of Movie Maker for the 800?

Chaps,

I'm the proud owner of this on tape and as we all know, loading any game from tape isn't exactly a speedy process. To date, I've not found it available on floopy and suspect it was never made availsble for sale on disk (PLEASE enlighten me if you know differently and can tell me where I can buy it!!!)

So do any of you know ehere I could locate a copy of the file needed to play it via Atari800WinPlus? I can be damned if I can find it, and even the author Kevin Toms doesn't list it as available on his own website and he probably wrote the damn thing!!!

Please help, otherwise I'll be forced into running a ZX Sprecrum Emulator and that will never do!!

Rob

I think this was on ST. But you say you have a tape of it, I don't think
the ST had a tape drive. The author's site doesn't mention 8-bit Atari,
but it was for C=64. I've never seen it and can't find it in my archives.
There are some utilities to get the program from tape to a .cas file that
is usable with some emulators.

Hi

I'm looking for any of these Atari 800 RAM/ROM modules:

http://img.photobucket.com/albums/v660/lbaeza/Atari/atari800c.jpg

If, by any chance, you have some of them, and want to give away (or
sell) I'd like to hear from you.

Please contact me right here or send a mail to lbaeza (at) yahoo (dot)
com.

Regards

Agreed, indeed!

It is a pity, but this Mike Hohman disappeared without traces, it seems
...

We from ABBUC in Germany tried for years to locate this guy for getting
permission to keep the outstanding products from OSS/ICD alive. But
maybe he lost so much many on that, he will never show up again ...

In the meantime "everybody" around the globe re-produced and still
re-produces some of those products. Personally, I put MAC65, ACTION!,
BXE & BXL in one cart and provided this hack to others as well. You
might find it on the net together with digitized original manuals as
well as German translations of some stuff ...

>From Poland you can get re-engineered SpartaDOS X carts and Indus GT
drives (called CA 200X) which work as perfect as the original versions.

The risk to get sued - I consider it to be zero as long as there is no
big company envolved and you are doing it to keep the ATARI 8-bit scene
alive and kicking.
If someone might start to make big money out of it, he or she can get
shot ...

To all those who had successfully re-produced manuals and software:

Not only selling re-prints and copied disks or images but offering free
downloads might be more effective. Have a look at ABBUC InfoThek
(http://www.atari-portal.net/iframe.php?file=http://www.strotmann.de/twiki/bin/
view/Infothek/WebHome)
to get a glimpse of what I mean.

Register there and upload it for the community's sake.

Gx & GoodByte

It was available as you'll see from
http://www.vintagecomputer.co.uk/vcshop/scripts/prodView.asp?idProduct=3447.
I can only assume the author forgot he wrote it!! It's also likely it was a
UK only release. I've already tried creating a .cas file without success.
Thanks for the reply though.

Anybody else got any ideas at all?

Rob

I have an original copy of Football Manager on tape right here before me.
The manual says it's to be loaded with RUN "C:". You could try CLOAD and
save it back to disk, but I guess the program is somehow protected against
such a simple technique.

Or you could try to copy the cassette file from DOS (or any other file
transfer program) to disk. Under DOS use C C:,D1:
Afterwards you could probalby RUN D: it fom disk.

All this won't help, of course, if FM has a loader which then runs the game
itself.

If I have the time this coming weekend, I will try some other things
including various CAS to DISK copier or CSIMS, if nobody comes up with a
solution in the meantime.

Cheers,

Frank

Assuming it was a single boot tape, did you ever try the
utilities which might
convert it to a boot disk or possibly a bunary file? That could
be a step
toward transfer into an emulator.

Jess

WWW.Atarimania.com has Football Manager. The version they have has
been converted to a self-booting DOS ATR. This is unusual for
Atarimania who prefers CAS files and new DISK or ROM dumps (but I guess
they'll take anything if they don't alreay have it).

To run Football Manager on Atari800Win Plus first enable BASIC and then
load D1: with the Football Manager ATR and reboot.

It seems to work but I know nothing about UK football (soccer).

To get Football Manager go to www.atarimania.com, click on "8-bit",
search for football manager, and you will find it.

Enjoy.

I have a dozen Microtek AMB-32 boards, unpopulated, 32K memory
boards, which I could populate one and send you to test in the

Atari 800. I'm told they may not work without some kind of mod
but I am willing to load one with parts and let you have it to
try out. Then if it does work, you can buy the bare boards, or
I can populate them for you. I'll have to work up a price, but,
let's see if they work. I only have a 400 and 800XL, so that
makes it hard for me to test them. Let me know if this is ok
for you. Thanks.

Hi Bill

Thanks for your offering, but I'm looking for the modules produced by
Atari in the 80's.

It's good to know of alternate sources though, these boards are getting
scarce.

Regards

Near the bottom of the parts block list.

http://www.best-electronics-ca.com/800.htm

Might just be the cards without the casing,
but still, I always removed the casing for
the dissipation of heat anyway. Wish I had
an 800 to test these ram cards in. Difficult
to test things without the proper machine.

Does any machine readable (HTML or PDF) version of the original OSS
Action! manual exist?

(I have the Toolkit PDF but not the original cartridge manual).

Hi Bill

> Might just be the cards without the casing,
> but still, I always removed the casing for
> the dissipation of heat anyway.

I've read that 800s had a 'freezing' problem because of the casing not
allowing proper ventilation of the modules. My 800 came with the bare
board modules, no casing. I'm looking for the ones with casing, because
I feel those have the 'look and feel' of the 400/800 line. I don't like
to see those bare boards into the 800...

> Wish I had an 800 to test these ram cards in.

What kind of mods have compatibility issues with the boards you build?

Regards

They aren't boards I build, they are boards I bought
accidently thinking they were something else entirely.
Now that I know what they are, I've asked around and
have been told there may be problems with these boards.
If and when I get a chance to build and test one, and
find that they don't work, the people I asked will tell
me what to do to them to possibly make them work.

I am currently reproducing the ACTION! manual and about 33% done. It
will be available in PDF and print if people want to purchase a copy.
I just finished the OSS BASIC XL manual and is available for download
and purchase also.

Download:

http://www.8bitclassics.com/product_info.php?cPath=24_33_62&products_id=527

Purchase:

http://www.cafepress.com/8bitclassics

ACTION! should be done in couple weeks hopefully, and after that will
be probably Mac/65, then BASIC XE. I will also be adding the Toolkit
text to the ACTION! manual.

If any questions, please feel free to reply here or preferably shoot
me an email at corey@8bitclassics.com.

Thanks,

Corey

While I am posting, I took part of the BASIC XL book that I redid
(ATASCII part in the appendix), and made up a conversion sheet
(decimal/hexadecimal). Prints off as 8 1/2 x 11 and is great printed
back to back. Can be downloaded at:

http://www.8bitclassics.com/forum/viewtopic.php?t=27

Thanks,

Corey

> ...You have a very good argument. I have a Supra hard drive interface and do
use it with an 800XL. An adaptor would just enable me to switch to an
XE (if I wished). I just wondered if there was any around. <

Just out of curiosity, what hard size/drive(s) do you use with your
Supra interface? Do you use a Bridge Board (SCSI adapter) or an
imbedded SCSI drive, and did you get an original Supra or a later Klaas
version?

I looked (briefly) at making/selling a new cart expander + adapter.
No problem making 1 or 2 hand-made prototypes, but to get commercial
quality boards, etc, it was several hundred dollars for a couple of
prototypes + then a minimum run of several hundred units to get
commercial quantities to sell. I would estimate that 100 would be a
"lifetime supply."   To say the least, the economics look unfavorable.
 But perhaps could be done less expensively elsewhere. -Larry

I see one for $19.95, which I guess is the cart and some documentation.
Then there's just the cart for $9.95. There may be a minimum puchase
and sure there is ship and handle.

Ah, that's why I couldn't find it either. Thanks for the de-restriction.

Mind you, with red and grey text on a black background, on a 1280x1024
screen, it can be hard to read at times.

Must have missed that one when I fixed the rest. Glad it is helpful.
I might be adding the key commands to reproduce in the future also.

Yeah, I understand on the colors, but wanted something that matched my
site and that was the best one I could find.

Corey

Hello All,

I am clearing an overstock of Atari to RCA (phono) 2m (6.5ft.) gold-plated
mono TV cables, with prices starting at US$2.50 including shipping to any
country. These plug in to the Atari's monitor socket, and deliver far
superior video and audio quality than the standard RF modulator. All you
need is a TV (or monitor) with RCA inputs (virtually all TV sets, even the

cheap ones, should have at least one set of these).

Full details, with PayPal order buttons (you can pay directly from your
PayPal account if you prefer) can be found on the website. This offer is
only for readers of comp.sys.atari.8bit, so go directly to the offer page
at:

Uhm. I went to site, the purchase buttons are $4.00 for 1, $6.00 for two.
Seems like should be $2.50/$5.00?

Hmmm looking over his message, he says pricing starting at $2.50...it may be
a quantity discount.

I can work around it by upping the font size temporarily. It's just that
I often forget to drop it back.

Memory like a, err, you know, thing with holes in.....

I said 'starting' from US$2.50. If you buy a pack of three, the price is
$7.50, which makes them $2.50 each. There is a base shipping cost with the
Royal Mail, which means it costs the same to ship 10 grams as 100 grams.
That's why buying a single cable costs more (per cable) than buying three.
Once you've gone past the base charge, the cost per extra 100 grams is a lot
less. That's why shipping more costs less per cable.

Either way, it's ridiculously cheap. It includes shipping, it's almost, if not free. Dean rules!

Particles! BBS has been online, more or less, since 1992. We feature:

- USENET and DoveNet
- 10000's of Classic Gaming Files (C64, Apple II, Amiga and many more)
- Active online games, LORD, TW, and much, much more.

The BBS is online 24/7 though down when we have the big thunderstorms come
through the area :)

Check us out at:

telnet://particlesbbs.dyndns.org

Or you can visit via Java telnet program on the main website.

Retroputing:

The forums are dedicated towards the discussion of older computers, ie, "retroputing". Though there are many sites dedicated towards conversations and information sharing on the topic of classic gaming consoles, there didn't appear to be much in the way of forums of all old computers - normally sites are dedicated to a single system. I'm hoping to change that and create a bit of a community for all fans of older computers. Hopefully you'll check it out. Thanks for your time!

Brian

I see $7.50 for three. Sure, cover the shipping. Sorry. Yes, a great
deal,
and I would never use a RF connection.

Yes, I've heard :). Look at this link: http://pasiu.krap.pl/ ... My
brother (Pasiu/SSG - author of the Project F7 accelerator) has
announced that this card will be released on spring next year.

http://pasiu.krap.pl is in Polish language only - English version will
be soon, I hope ;)...

Anyone remember a type in from A.N.A.L.O.G. called ATASCII Animation?
I used this program quite a bit in my youth, but Cyberroach's site is a
little limited (not one A.N.A.L.O.G. I owned is on his site).

I've tried looking for it on various ftp's and sites but to no avail.

The reason I'm asking is beacause I'm porting some of my favorite basic
apps from mags to Action!

Another program from A.N.A.L.O.G. that I'm looking for is a calender
type program. All I remember is, is that I used it lots, had green
screen with overlaying menus and input dialogs.... I think it was in
the same mag as the V: handler..

Can anyone help me out?

No prob, if anybody can think of something else that would be useful,
let me know. Preferably via email.

Started moving again on the ACTION! manual, try and get that done
soon. Just busy with everything. I am hoping to retain some of it so
I can maybe make a game with it. Same goes with the Mac/65 manual :)

Anyway, glad it is coming to some use. Been downloaded a few times
and did post it up on AtariAge.

Corey

Thanks. I was hoping for some hands on expereince with someone in the group,
and how it compares to the atari win plus 4.0 or atari++.

I will have to give it a try. I've also heard rave reviews regarding the c64
emu on the pocket pc. Playing Pirates would be great on pocket pc using the
pocket 64.

Looking forward to trying star raiders on the pocket atari, and also
Interstel's Star Fleet II..

Finally!

I finally managed to scrounge a TV tuner/video input card for my Performa 5200. What does this mean? It means that I now have a monitor for my trusty old Atari 800XL! As a matter of fact, I have my Atari 800XL hooked up to the 'video in' port on the back of my Performa as I type this.

It's really quite clear! I'm amazed! I wrote a rinky-dink little Basic program (five or six lines - nothing special) just to get an idea of the image clarity of this card. Ya know what? It looks pretty damn good! Of course, I have to reach over and press the space bar every once in a while because attract mode kicks in.

Heck, it's been so long since I've actually done anything with the old boy that I'm thoroughly surprised that I remembered to poke 752,1 to hide the cursor! Looks like I'm gonna have to break out the old 1050 floppy drive and the 300 or so 5.25" floppy disks that i have kicking around. Yeah!

Oh yeah, and I finally managed to get BSD installed on my Quadra 700. I'm thinking about doing a BSD install on an LC III and putting it online. Why? For people to hack! Come try to hack into my LC III running NetBSD 2.0!!!

I'll keep ya posted...

Regards,

William

I read that the demos were made with the "slow" version of the
accelerator. The faster version was to have a cache to further enhance
performance. I don't know which the final version will be, but either
way, it will be a tremendous accomplishment.

Now all we need is a good 80-column adapter, and we'll be ready for the
big leagues! ;-) -Larry

I was just reading about HIP and RIP mode on the 8bit Atari's
(400/800/xl/xe) and it sound's pretty cool! Does anyone have a link
or a picture they could send me of what it looks like in one of these
modes on an 8bit?

Here are some HIP screenshots (presumably from an emulator) of A8JDPEG,
an Atari 8-bit JPEG decoder/viewer:

  http://www.myatari.net/issues/may2001/jinks.htm

I spent a coupla minutes Googling, but it's hard to come up with good
links quickly. Good luck! :)

    Nice find. It should be noted that HIP looks much better on a real
  television that it does in the emulator screen shots.

Steve

I know I know!   I found alot of dead links and more info... too bad I
dont have a SIO2PC for my 65xe yet or I would try some of the demo's
out myself.   Just wanted to get an idea how it looked.   Judging from
the pics you linked too I would say not too good, but then emulators
never look as good as the real thing...

I'm looking for some more 1200XL computers. If you have any for sale please drop me an e-mail.

They dont need to work and non-functional (but physically intact) keyboards are ok. They just need to be intact, no missing internal parts, no missing/broken off keycaps, no missing plastics or chrome parts.

Thanks

Steve

Have you seen these?
http://www.angelfire.com/80s/rjespino/8bit/a8jdpeg/gallery.html

There are several HIP images there, they're good enough to easily
recognise the people in the photos (if you know who they are of course
;).

The quality varies with the image used, images with a lot of small
details don't come out as well, portraits and Anime style images tend
to work better.

I have the RAM and ROM modules for the Atari 400 computer. They're nothing special, just the stock Atari units that shipped with the 400s. If you're a bird, you can have them for a song. Barring that, you can make me an offer.

Regards,

William Reynolds

ps. My last name isn't really Reynolds.   I just typed that because I'm a born liar... Not!

Do you have the Mac/65 toolkit manual also? I have it in storage. If you
need it, let me know I'll make a copy.

Not exactly pocket pc, but atari800 (http://atari800.atari.org) has a
build for smartphone 2002 cell phones (maintained by my brother :))

Don't have any Mac/65 manuals yet except the one I found on the net
which I will be replacing. If you would like to make a copy, that
would be great!

Will do the same then for the Mac/65, add the toolkit manual as part
of the original manual.

Corey

What I will do is make some high quality scans turn them into jpegs and put
them on my website. I should have it done before end of month and will post
the links here.

You gotta be pretty lazy to auction off your entire collection with just
one photograph taken from a distance. You can't even see anything except
for ~ 5 pieces of equipment.
At least take a few pics from inside the locker. The guy obviously
doesn't care about getting market value for his items, as this auction
raises a big ol' red flag.
My prediction of final selling price: $112

Anyone else wanna make a guess?

I agree with the other posters, your brother needs more pictures to
back up the descriptions, also pics of the misc cables, books and
stuff.

(I'm glad my storage isn't that piled up... Though it is getting
there...)

Larry

This is my collection. I would be willing to bet that none of you have ever had to acquire, store, pay for, protect and maintain a collection this large for five years. Looking at the picture do you believe that I have instant access to prime pieces to photograph them? Don't you already know what they all look like anyway? Do you think I am lying? Anybody can get pictures from somewhere else and claim that they are their machines. If I was to post a couple of pictures of Macintoshes and cables and would you feel better? I can't take pictures inside the locker because I can't get into the locker. It's too full! And it doesn't make sense for me to start ripping packages open (as you would know if you read the whole eBay description) because as they sit now they are protected. It is just not feasible (due to the fact the stuff stacked almost ten feet high ten feet deep, the primary purpose of the photograph which is also explained in the description) to start tearing the place apart looking for a needle in a haystack. As the description says I am not selling anything super rare. If you know anything at all about vintage computers you should be very familiar with what I have listed and shouldn't need to see a picture, if you do there is plenty of that kind of stuff on the Internet. If you want to come see it in person by all means I will show it to you. I am protecting these computers as best I can. As the collection grew I was forced to rent a storage locker, as I was not considering selling the collection I did not take into account that I should pack it in any other manner other than the most space efficient and protective. Considering the circumstances this is the best I can do. It's easy to be critical. If you have the practical experience and you could do better by all means let me know.

S :-)

You probably found this in the FAQ (section kept by Freddy Offenga):

    - PL65 (disk)
      version, year : 1.0, 1987
      author/company : Noahsoft
      available..... : commercial, Extremely rare.
      package....... : compiler, editor, library, sample game
      features...... : Similar features to Action with same restrictions.
      Highly flexible language that includes inline assembler features and
      pointers. Robust and well-engineered editor. Does not require
      additional runtime library - automatically generated and included in
      the compiled code during compilation.

This is a major release and perhaps the last for a bit, including

segment and byte modification as well as a small assembler:

http://sourceforge.net/project/showfiles.php?group_id=145747

New features:
- Bytes in the dump window can be edited.
- A small assembler is included in the dump window.
- A log window displays log and error messages. No more message box.
- Segment properties (start address and type) can be modified.
- Added an option to split a segment
- Added an optin to remove bad segments (generated by xmodem padding).
- Ability to generate relative labels for an address range
- New dialog box to customize default path for all kind of files.
- Output format is now saved in INI file
- The address of a label is displayed as a comment when selecting a
  line in the disassembly window.

You are correct. One of them has been modified as well with normal/slow
toggle, knob for slow speed adjust, and a note by the dips that reads "aux
4 up protect off" (as if the dip switch functionality has been changed to
suit another purpose).

Hi,

i just remembered a scene from a game which i played 15 years ago on my
good old XL. The problem is, i cant remember much.

I think it was something in a human body and the player was fighting
against a virus or something.

Has anybody an idea?

Probably "Bio Defense".

The version I played had speech.

my question:
http://www.lawguru.com/cgi/bbs/mesg.cgi?i=646134828

their reply:
http://www.lawguru.com/cgi/bbs/mesg.cgi?i=226057143

in other words, just as i had suspected, Lance Rhenquist would need to establish copyright ownership for which he obviously has not and cannot; that bill of sale from Bob Klaas to Lance Rhenquist only specifies BBS Express Pro and certain (only certain but not a blanket coverage) source code written for SpartaDOS 3.3 including code written by Bob Klaas, Chris King, Steve Carden, and others mentioned in the bill of sale. Lance Rhenquist not only does not hold the copyrights to any FTe or ICD products nor is he the copyright owner of said software as he has not been able to establish ownership. As I stated before, I don't even think he has the source code to any FTe or ICD softwares excluding that particular code written by Bob Klaas for SpartaDOS 3.3

Somehow I do not think Mike Hohman is going to come after me or anyone else who uses or disects or enhances SpartaDOS, Action, or anyother FTe or ICD softwares; but if Mike were to come after me, he'd also be able to go after Lance as well, correct? After all, if we want to get picky, Lance maybe illegally copying ICD and or FTe softwares and

selling it for a profit (and at the same time claiming false copyright ownership).

Lance has nothing on me (or anyone else who chooses to "hack" SpartaDOS), nor has he any ICD or FTe source code as he has claimed.

This matter is now put to rest; Do not be afraid to do with SpartaDOS or Action! or BASIC XE or other ICD / FTe softwares as you will (i guess so, or at least until the true Mike Hohman or true copyright owner speaks up and requests a stop to this)

Woodzy

Reminds me: is there a complete list of Atari 8bit games with speech synthesis?

The titles I had known yet: Castle Wolfenstein, Tumble Bugs, Kennedy

Approach (great!).

Wasn't there some in Whomper Stomper (I think it was?). Also opening of
Ghostbusters, A8 version lacks the in game speech the C64 had, sadly. Poker
Sam (well, if Tumble Bugs counts)

Hi, Anders!

Still Atari for you too? Long time. Still got hardware or are you using
emulators?

How is Sweden for Atari 8-bits? Anywhere to buy stuff or any clubs or
something?

Take Atarian care

Well that is good news since I sell AtariMax's cart versions of OSS

programming software like Mac/65, Action, BASIC XL, and BASIC XE. I
was under the assumption that these were in the public domain now?

I have also reproduced the BASIC XL manual in PDF form and will be
selling repro's of the PDF in printed format. Currently working on
Action!, then Mac/65, then finally BASIC XE. PDF is available free
from the site, the the manuals will be for sale minimally over the
cost of printing.

Are we talking _synthesis_ or _digitization_? :)

For example, Poker Sam was synthesized, whereas Ghostbusters was digitized.

Yes, that's why I said if Tumble Bugs counts, cause that's synthesized also.

And an obvious I forgot, Pop'N'Rocker (Parrot program) has digitized sounds.

Nope, not unless they were put into the public domain by the copyright
holders.

They probably fall more into the realm of AbadonWare. Copyright laws (in
the US and any country under the Berne Convention <IIRC>) extend for at
about 75 years (depends on a number of factors) and they could bring a
lawsuit at any time. It's different than trademark law where you have to
protect your trademark or risk losing it.

There is the issue of damages though... not too much money changing hands
with this old software. Still, you are taking a certain risk selling
someone else's work.

Don't get the wrong impression-this is all just information. I'm all for
keeping the 8-bit alive.

Sorry, but that's not correct. The "enhanced" version of Ghostbusters
uses the same speech engine that Kennedy Approach uses ("Electronic Speech
Systems Berkeley" IIRC), it's both (mostly) synthesized.

Another game - though most likely only available in germany - was "Nadral".
This one was digitized speech.

So long,
     Thomas

> something?
>
> Take Atarian care

Hi there Vidar,

I am happy with my quite large collection of Atari stuff, the favourite is
probably the Atari 800, which with its 810 disk drive looks super
cool. It is the perfect style item representing year 1980.

I use it to write assembler programs occasionally.

Sadly, most of the collection is packed in large boxes, waiting for the
day that never comes, when I can open a mini museum. Museum sounds
boring, doesn't it? It should definitely be an action filled museum.

There probably is at least one Atari club in Sweden, but I am a lone Atari
ranger.

From 1995-2000 I bought lots of Atari items on flea markets. Today
almost everything is gone. The only thing I can find is broken
Sega Megadrives (Genesis).

Anders

I don't have a problem getting permission, as I have received
permission for reproductions on couple other items. Don't even have a
problem paying for the use on items also as long as it is fair. But
until them, specifically on these items, it will be a wait and see I
guess. I have had so many requests, finally got some people to send
me their copies of the manuals to reproduce. Just decided to offer
printed versions for those who don't like reading on the screen. Just
ordered a copy for myself to view before make it public.

(sorry for the slow reply)

Lol, it wasn't exactly stored in a closet... I stuffed it in a shed at my parents place several years ago after being evicted from my rental house. The landlord died, and his kids kicked me out. I had nowhere to put my beloved atari equipment, so it got stuck in a shed, exposed to high humidity, extreme summer heat, and bone chilling winter cold. Only thing that was in need of cleaning was the 1025, but all the pens for my 1020 dried out. :(

Considering the lousy location I stored itin, i think I was incredibly lucky all I had was a wad of mud in the drive belt.

I have a 130XE with various mods already performed to it, and I am ready to upgrade the memory.

After reading an article in Antic Vol. 7, #7 by Dr. Brilliant, I noticed you start loosing things after the 320K mark. At 576, you loose the built in self test (big friggin deal), but the 1088K mod kills the built in ROM BASIC.

I would like to retain my built in BASIC, but could care less about the self test.

Anywhere I can buy the 576K upgrade? Or find a schematic & component list to build my own, and maybe a place where I can buy the shit I need for it.

Hi, I'm Ben Smith here in Portland, Oregon USA! Proprietor of Bravo Sierra Computers! Occupying a unique niche in the Atari World! Most Atari Dealers sell NEW, I also sell Used Atari Goods! Not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you wont find at Swap Meets, Thrift Stores or Auction Sites! And I sell for less! Unlike those remaining anonymous! I test Goods before I sell them. Not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, because I'm the guy people goto to give Ataris a New Home! Saving Orphaned Atari's from Oblivion!Goto http://BensCatalogs.Atari.org or (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

I don't know of any.

But it maybe on the net somewhere.

I've tried to contact ICD, but get no reply regarding Atari stuff.

If not, someone who has one with the right knowledge and time could
come up with a diagram or schematic.

I wonder since it has 2 cart ports if more than 2 could be made in a
design?

Not sure if it would be useful or not.

A problem with the old ICD stuff is small market and obsolete designs.

Just as a for instance, you would want an XE adaptor *IF* you had a MIO.
  The MIO's were designed to use Zip<?> RAM which I doubt is still being manufactured. No one will ever make the old MIO's again. Not trying to be brutal, but the way to do it would be buy an 800XL to use any old MIO someone finds because it would be cheaper then trying to get a run of XE adapters made.

I think a good test for viability would be: Would a good designer use the same parts today? There was some stuff like a 6551 in the MIO that was good'nuff to still be used, but the way RAM expansion and a scuzzy hard drive were added is very questionable.

Faster/cheaper/lower current/static CMOS memory is available that eliminates the need for refresh. IDE is ubiquitous and is the way to go.

About the only thing it would change in the way we work is to have huge battery backed up RAMdisks so we wouldn't have to reload whatever we wanted to work with that day.

Hi there,

I'm running DOS 2.5 on an emulator and I have a disk image with a bunch
of games on it. When I do 'A return return, I see all the names of the
games, but then when I type 'L' and it asks for the name and I type
SHAMUS or SHAMUS.BIN or even SHAM* I get an error 164. What is that?

Thanks

Regarding FTE,

Has anyone had any contact with the owner(s) of FTE regarding the ICD
Atari
8-bit items that they suppose to now own?

I would like to know if they (FTE) have any plans to sell now or in the
future any of the ICD Atari 8-bit products that they got from ICD, if
they
have anything left??

I would like to see SpartaDOS X supported and improved upon if
possible. As well as some of the other software and hardware.

I find 'File number mis-match' for 164. Could be
the ATR is corrupted. Seems like you have to say... D:SHAMUS.BIN or

D1:SHAMUS.BIN
I'm not sure.

Hi Ben,

Have been trying to mail you but your replies comes back as emails with
nothing in them (getting paranoid). I'm interested in one of your books
and trying to find out the UK postage costs or if you'd be interested in

doing a straight swap for one of the PeST mouse interfaces.
http://www.retro.dial.pipex.com/pest/

Thanks,

Aly

Hi again Ben,

Have just picked up your messages, eventually telnetted into the POP3 server
as my provider recently overhauled their web client to make things
easier....

Awww, really dissapointed. Have been hunting for that book for ages :-)

<<ST Disk Drives:Inside and Out>>

Is earmarked for Exxos's and my next embedded ST project.

Thanks again for replying several times, apols. Keep up the good work. :-)

Friendly regards,

Aly

The circuit design is very simple. I think it could be fabricated with
ease.

Hello,

I can offer these games, boxed + instructions, still sealed in some
cases.

I can ship worldwide and I'll accept paypal.

Most of the games are PAL versions, if NTSC is not mentioned.ATARI 800
XL/XE cartridges are NTSC, but also work on PAL machines.

Please note that I'm in Germany and shipping can be expensive.

Because of the high shipping costs etc., please try to buy games for at

least 30.- , because I cannot send single games for 1,50 or 2.- /

package materials are too expensive for small packages.

It's possible to send up to 150 games in 1 package, please ask if
you're interested.

I can give you pictures/scans of the games, if you want.

email : ulrich_sternaxe@gmx.de

Neither of those seems to work either. I notice that the names when I
view the directory seem pretty long, things like FLIPANDFLOP. Are
those names too long for 2.5? I'm using Atari800Win 800 OSB. Should I
be emulating on a newer model?

Sounds like you need to use MyDOS or SpartaDOS

In my experience, almost all games on ATRs are configured as a SS/SD dos
2.0/810 drive (719 sectors, with 707 usable), or as a dos SS/ED dos 2.5/1050
drive (1023 sectors with 1010 usable).

So if your using DOS 2.5, you should be fine, but if not...

http://www-users.rwth-aachen.de/mathy.van_nisselroy/mydos.htm (appears to be
down at the moment. I hope it's just temporary.)

https://www.chebucto.ns.ca/Services/PDA/mydos453.dcm Dunno which emulator
you're using, but you might be able to use dcm images with it. If not,
you'll need to convert it to an ATR. Here's one of Mr. Tucker's utilities to
do just that: http://www.atarimax.com/imagic/download/imagic95.zip

ftp://ftp.atari.art.pl/stuff/mirror/homepages.paradise.net.nz/atari/atari/atr/
apps/Mydos%204.53.zip
(thanks to XLSearch & Bill Kendrick!)

Also, if you download APE from www.atarimax.com it comes with several ATRs
and at least one ATR of MyDOS 4.53 and SpartaDos.

MyDOS is so very close to DOS 2.0 & 2.5 that you should just be able to fire
it up and run. If you need to know anything else, check out Mathy's page
above, when it comes back up.

Good luck with that.

Jerry Fulkerson!

You may have seen Jerry post a while back that he was looking to get rid of all his 8-bit stuff prior to a move, and I was lucky enough to become the recipient of it this weekend. Except for the gas I put in my car to make the trip upstate, I got a great pile of hardware, software, and more technical manuals that I could ever read for the low low price of FREE. The guy wouldn't even take money for gas after offering to meet me partway down to save an hour from my trip. Needless to say, I couldn't wait to start going through the 9 (yes, 9) boxes when I got home. Rumor has it there may even be one more hiding somewhere in the Fulkerson garage...

I will be doing my best to pass on the favor by offering up a number of the items, such as some of my now duplicate books and carts, to anyone who is close enough to pick up or is willing to pay the shipping to get them. Right off the bat, I can tell you I'll be looking to pass the cassettes and the ANTIC magazines (and there's a lot of them) on to someone who will have

more use for them than me, so give me a yell if you're interest. The rest I will post for grabs after I have finished sorting through stuff. Here's the haul:

http://www.slor.net/a8/photos

Thanks again to Jerry for the ultra-generous donation to Slor's 8-bit collection - should he happen to ever read this group again. For the rest of you, I thought I would share this excellent experience dealing with a former Atarian.

Hi Slor!

What is this, below the ATARI 800?

Best Regards,

Daniel Mandic

Well, there are two 800s stacked, and below them is an 800XL.

Anyone know anything about that monitor? It's a Sakata SC-100, and I had
never heard of it before.

The other item I know I don't have use for is the XMM801 printer. If
anyone has use for it (and/or the spare ribbons), let me know.

Looks like it's 1980 again (except for the 800XL)! Nice score there!

My Atari joysticks are crap (except for a rare Newton Design). If you
will be parting with any of the third party joysticks I'm interested.

I know this is not a trivial hack, but would it not be swell to add a
USB port to the Flashback 2 so you can attach a memory card reader so
you can play atari cartridge images (.BIN) on it. That would be the
killer app for this, cuz then people can program their own Atari games
and not have to burn any EPROMs or anything. Please request this in the
Flashback 3.

Can these drives work with an Atari8? They have cables coming out of them
but also have connectors on the rear of the case. Can you bypass the
dedicated cable and hook up your own 50 pin. I have seen a couple lately on
eBay for not much money.

I have two empty 1050 drive shells I will give away for postage. When I say
empty I mean the disk mechs are gone . The other electronics are intact
though. They were for someone who posted here but didn't come though.
Postage would be between $5 and $7. Depends on where you live.

I think you're talking about and ECI to PBI
adapter. It is used to attach and MIO or Black
Box to the 130XE. Is this it? The 130XE has
a ECI port. It is a cart port plus another port
that adds up to a PBI port.

Yes, but you must have the correct host adapter. I have one of these
Supra ST boxes, and it has a 3.5" Quantum SCSI drive in it. That means
that you pretty much have to have a CSS Black Box as a host adapter,
and it needs the parity option. The BB is still (IMO) the king of the
adapters, but the KMK/JZ or MyIDE adapters are definitely excellent,
lower-priced alternatives. -Larry

> I think you're talking about and ECI to PBI
adapter. It is used to attach and MIO or Black
Box to the 130XE. Is this it? The 130XE has
a ECI port. It is a cart port plus another port
that adds up to a PBI port. <

Yes, the MIO's were designed to be attached to the PBI on the XL's (not
1200). The ICD 130XE adapter had the ECI (male) on one side and the
PBI (male) on the other with *two* cart ports on top. The BB, on the
other hand, is designed to mate up to the 130XE and uses a ribbon cable
to attach to the XL computer. The 130XE adpters are *rare*. If you do
find one, have your wallet prepared.

From what I understand those are pretty rare now. I have one but i'm
currently using it on my BBS.

I've been sorting through my recent acquisitions, and below is the
current list of items I'd like to pass on. Give me a yell if anything
tickles your fancy:

20 program cassettes
- Claimed by Frank.

Any spare joysticks that work
- Claimed by Stephen.

ANTIC magazines (most of the issues from 1983 to 1989)
- FREE for pickup or paid media rate shipping.

Atari XMM801 printer (yet untested, missing clear plastic cover, 4 spare ribbons)
- FREE - This one is going in the trash unless someone wants it.

Books: Mapping the Atari (Revised Edition, Chadwick), Your Atari Computer (Poole), and Atari BASIC (Albrecht)
- Asking $10 + media rate shipping for all 3.

If anyone is looking for a particular hard to find program on floppy, feel free to drop me a line. I now have a LOT of disks (many of which I'll never use) with a number of utilities and games that look extremely cool. Some originals and a bunch of other stuff.

Also, if you're looking for any obscure technical or software manual, I may have it in one of the numerous binders now in my posession.

Last but not least, anyone remember the Rampower 48K memory module for the 400 by Axlon? I found info on the company, but I could not find any trace about this memory unit.

Thanks!

Same here, only have one and need it when I use the MIO on the 130XE.

If these are in demand, it shouldn't be to difficult for someone to come
up
with a similar design.

I am interested in your ANTIC Mags for shipping (don't think you are
local). If you wanted to shoot me an email, my ZIP Code is 53806 so
you can get an estimate on Shipping.

Thanks,

Corey

No.. in fact if you look at the design it's a single layer pcb with no ic's
or anything..Looks VERY simple.

I had two 850s, neither of which I could get to work with my communications
software. I figured it was not likely they were BOTH bad, but I have
proven myself wrong by seeing a third finally work. Is there a typical
thing known to go wrong with these that I might be able to fix in order to
revive one of the bad ones?

thanks

I have a Supra interface for the Atari8. Would this work with a hard drive
for the ST?

> I have the Supra interface... <

Hi Michael-
The short answer to this is "very, very unlikely." Virtually all
3-1/2" SCSI drives have default 512-byte sectors. I don't believe that
the Supra interface was ever successful in getting past 256-byte
sectors. The Supra supposedly could use the Seagate 225N (5-1/4"
imbedded SCSI), because some variations of that could be formatted down
to 256-byte sectors.

Now it gets more complicated -- there are SCSI software tools available
that will *supposedly* allow formatting *any* SCSI drive down to
256-byte sectors. Personally, I've had no luck doing this for the MIO
(also 256-byte sectors). And that still doesn't take into account
other technical issues with "modern" drives. But good luck if you try!
 -Larry

In my past experience in fixing 850's I remember finding a bad transistor or two that inhibited SIO communication to the computer. This was usually related to the computer not able to load the R: handler from the 850. There's a 2N3904 transitor (Q103) and a transistor array (A109) CA3086 (Atari Part # CO10174).

Sometimes the 6507 that's used in them goes bad.

It's been over 10 years since I repaired a bunch of them. That's about what I can recall of the more common stuff that goes bad in them.

Do you mean it's an IBM AT style printer interface? If so can it be
configured as LPT2:

I've been wondering if the PPJoy driver will support a second Atari

Joystick via a second printer port.

PPjoy works great in Atari800Win Plus (and pretty good for MAME).

>

It's actually called "Card?/AT". It's made by MPP, has SIO plug on one end

and standard Centronix printer interface on other. No switches like the
Graphics AT had.

I don't suppose there's any way to tell from a visual inspection of the
board... I don't have the tools to figure much out otherwise, so perhaps
I'll try mixing and matching some parts from the two of them and hope to
find a working combination. :)

If I can get one back working, I'm thinking of experimenting a little to
see if I can link the 850 together with a MyIDE so I have a little all-in-
one unit stuffed into the 850 casing.

Then again... It's been so long since I looked at the MyIDE, I forgot it
requires connection to the CPU. Was thinking it only needed SIO pins.
D'oh! :) Shows you how much Slor knows about hardware.

Hi, I'm Ben Smith here in Portland, Oregon USA! Proprietor of Bravo Sierra
Computers! Occupying a unique niche in the Atari World! Most Atari Dealers
sell NEW, I also sell Used Atari Goods! Not only do I sell NEW Atari Goods
at a competitive price, I also sell used Atari Goods you wont find at Swap
Meets, Thrift Stores or Auction Sites! And I sell for less! Unlike those
remaining anonymous! I test Goods before I sell them. Not only can I sell
you some Great New stuff! But I can sell you hard to find 2nd Hand Goods,
because I'm the guy people goto to give Ataris a New Home! Saving Orphaned
Atari's from Oblivion!Goto http://BensCatalogs.Atari.org or (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

I believe the ANTICs will be picked up next weekend. Sorry. :)

Got a couple more books for FREE:
- Every Kid's Guid to Robotics and Computers (at least, that's a close as I
can remember the title right now)
- 49 1/2 Fun Projects for Your Atari

Neat version. Popcorn's actually a Jean-Michel Jarre song.
I've heard it on the Atari a bunch of times, in fact. (Probably the first
time I heard any of his music.) Tetrix has some of his tunes, in fact.
I've also got a collection of Amiga MOD music files of various interpretations
of "Popcorn." :^)

He covered it, yes. Composed by Gershon Kingsley for his LP "Music to
Moog By" in 1969. I recall hearing not long after that. Probably early
1970, I'd have been 9 at the time.

I'm not sure whether it was ever cracked to .COM type format but
the best Atari 8 bit database always used to be SynFile+.

I have been playing a little with the 6502 cross compiler CC65
which creates .COMs from C source and its quite possible some
open source C database (or an old MSDOS one) could be compiled
with minor alterations, although disk and memory is limited on
the 8 bits.

Okay, so it's nothing very Atari-esque, but it's my first successful
(in the US) cellphone game. Thanks to all my Atari pals for helping me
through figuring out how to program cleverly over the years. :^)

  http://www.penultimate.com/wordnerd/

Here's a pretty nice review it got, too!

Simple answer is an inexpensive clone game box that lets you play old
Atari games.

Complex answer is how they do it. Pirate Nintendo on a chip emulating an
Atari 2600. People have hacked cartridge ports onto these things so they
can play NES cartridges. Rumor is next round will be a native Atari 8bit

on a chip.

This answer is misleading. I know of noone that has hacked a NES
cart slot on a flashback. There are 2 versions currently. V1.o was
rushed to market and it is as you say a NES on a chip with ported 2600
games. The FB 2.0 is a 2600 on a chip and many hacks exist for this
model that allow you to add a cart port and run 2600 games.

The FB 3.0 will be some type of 8bit (400/800/xl/xe/5200) on a chip.

Let's hope the 8bit version (i'm most excited about this one) includes
ability to hack and add sio port and maybe even pbi.

Does anyone know anything about this PL65 language for Atari 8-bit
computers? Anyone had been using it? Has a copy of this compiler?

Regards,
tomekM

Alright, I need some help here...

I have a 1025 printer that is malfunctioning. What it does is, it
prints about a 1/4 inch of blackness for each line I ask it to print.

I ran a test in BASIC (LPRINTs) and at one point, it did print about 5
lines of text, then it went back to the black spots. I haven't been
able to get it to print right again after that.

Can anyone shed some light on this?

Thanks

I don't think he mentioned what will be in the FB3 though yet. The
only official "hint" from Curt was that there "might be" a FB2
portable variation with LCD screen.

He said it will feature 8bit tech, but in what form factor and how it
will be implemented are still a suprise. I havent heard of a portable
fb2 with lcd and I doubt one would be mass produced by Atari (altho I
know people are making them already) simply because the cost would be
too high for the price point they need for all in one toys.

I used to run the Black Hole BBS with Express under Atari DOS while it was
on an 8bit machine.

From the Atari 2600 to the Atari 7800 is 8-Bit technology. When he
sent me a preview unit for display at a show, afterwards, he mentioned
that he was looking using real hardware for the next project meaning a
true 650x chip along with other chips.

As for the LCD, this was posted by Curt in the AtariAge forums.
Surprised me as well, but is what I read. Can't be that much as you
can get a GBA SP for $80. I am willing to be people will pay $80 for
a portable 2600. I doubt it will use 2600 cartridges, but more of a
memory card type system, so Atari can release more multi-game paks to
make it more appealing to users.

Corey

when I say 8bit I am referring to the 400/800/xl/xe/5200 it is a
commen way to refer to Atari's first series of computers.

>As for the LCD, this was posted by Curt in the AtariAge forums.

I'll believe that when I see it!

What you may want to waste some time on is a goggle search for "Nintendo
on a chip" or maybe NOAC.

There are some cool implications. Other then the price of them appears
to be dirt cheap, they have relatively low power comsumption, and appear
to be quite hackable.

My experience with just about every micro producer of late had been
nothing but grief. Either they wanted $7,000 for their development kit
or 100% of their inventory or production went to cell phones. Looks like
these NOAC are out there in several hacks so at least you can get your
hands on one.

Gee, that sounds pretty good. If there is going to be a cart port, is there
also going to be carts produced and sold?

The memory card system sound pretty good to me. I would love a portable Atari
8-bit game system.

I recently dug my 1025 out of the closet and ran a few LPRINTS thru it. It did the same thing yours did, but mine had a mud wasp nest on the drive belt. Cleaned that off, let it run for 5 minutes and it prints just as good as the day I bought it.

Give it up for the longevity of Atari hardware!

That would be awesome;-).

It occurs to me, that all this redesign of old hardware may lead
somewhere. If Atari make enough money out of it, there could be a future
for Atari branded consoles. Just a thought, and probably a few years away.

Mark

Did anybody here attend the Atari swapmeet in Columbus? If so, please let us know how it went. When I got the last-minute news about Computerfest being on the same weekend I decided I had to give priority to the Dayton show, so unfortunately I missed the Atari event (again).

I hadn't been at Computerfest for about five years so there were big changes since the last time. The sponsoring club has reportedly gone thru organizational changes over the years, and what with receiving the e-mail announcement a mere one hour before the day of the show, it's no surprise that the show is no longer up to the level of past decades. That's a diplomatic way of saying that it was down to about 25 dealers and several hundred people attending, or about one-tenth of its size in the former glory days.

Small tho it may be, this show is still well worth attending if you're a bargain hunter. It's mainly laptops now, and they're very cheap these days. Computer innards and electronic supplies and parts, as well as Windoze software, were plentiful. And the numerous free seminars appeared to be very well attended.

I looked high and low but didn't see a single Atari item. (Of course, there were all kinds of things that could be USED in connection with Atari in one way or another.) But there was one display of 'classic computer' interest -- in this case, 16-bits: an Amiga dealer selling software including emulations for Windoze, Linux, and even the Apple 8-bit. (I wonder if Atari ST-ers are doing as well as this these days!?)

Since space for this show was arranged in connection with the big Dayton LANFest computer gaming event, the best that we can hope for next year is probably that Computerfest will survive but it would have to be based on the same kind of deal. If so, that portends another "conflict" with the traditional weekend of the Atari swapmeet.

Hello Vidar, remember me? (express beer to Poland :))

Probably you are dealing with non-sapmaker-created saps. Unsap can deal
ONLY with saps created with sapmaker (also from fox). If your sap was
not created with sapmaker then unsap.pl can not convert it to its
original format :/

Greetings from Poland.

PS. Type title of song that you want convert, i will look if I have it
in original shape :)

Did you want one original flashback, and one flashback 2.0 ?

If so, that will be $20 for Flashback, $30 for the Flashback 2,
$35 to ship and $10 for me, for a total of $95.

Keep in mind that the 2.0 is not yet in stock, but can be preordered.

No particular ones, I just want to be able to use them in demos or

something. The two pieces of music I would love to have is, Alternate
Reality : The City and Passionately, but I think they are in a special
format, coded note by note, by the brilliant Gilbertson (I think)

I used to maintain the Atari 8-bit section of the UMich archive, but then
they closed all external accounts, so I no longer had access. I was
mostly through organizing things in there, so what organization you do see
is my fault. ;^)

I'm sure it'd be easy enough to mirror the UMich stuff somewhere, these
days. (At least the 8-bit Atari stuff, which is what >I'd< personally
care about!)

Back when I maintained it, and Shareware.com was created by C|Net, I got
them to add the Atari stuff to their search index. Sadly, they lumped
the Atari 8-bit in with the Atari ST stuff. *sigh*

Thus, XL Search was born. It's kinda been born again as XL Search 2.
I really need to get off my butt and finish updating all that code. :^P

Hi, I'm Ben Smith here in Portland, Oregon USA! Proprietor of Bravo Sierra Computers! Occupying a unique niche in the Atari World! Most Atari Dealers sell NEW, I also sell Used Atari Goods! Not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you wont find at Swap Meets, Thrift Stores or Auction Sites! And I sell for less! Unlike those remaining anonymous! I test Goods before I sell them. Not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, because I'm the guy people goto to give Ataris a New Home! Saving Orphaned Atari's from Oblivion!Goto http://BensCatalogs.Atari.org or (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/

Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Hello, The flashback 1.0 is on sale where I live. If you are
interested in one or two I will charge you the retail price
(16.99+tax) + actual shipping and you can add whatever you want extra.

You will need to send the money Paypal. Thanks and contact me
at this email: kev242@gmail.com

Technically speaking, the Atari 2600, Atari 5200, Atari 7800,
Atari 400/800/XL/XE/XEGS computers and Atari Lynx handheld were all '8-bit'
systems.

But, around here when we say "comp.sys._atari.8bit_", we're talking the
8-bit line of computers, starting with the 400/800 and ending with the XEGS.
(To a degree, that also includes the Atari 5200 game system, which was
more or less a stripped-down Atari 800 computer with no keyboard and
apparently very crappy controllers that were prone to breaking. :^))

So yeah, XEGS. That was really just an Atari 65XE with built-in
Missile Command, and a detachable keyboard, sold as a 'game system'

at around the time Nintendo was huge in the market. D'oh!

Anyone out here correct me if I got any of this wrong... ;)

In relation to my earlier post about my dead 800, it seems that it has
died in such a way that any power supply that I've tried to use it with is
now also dead. My multimeter doesn't show a short, but I have a bunch of
CO17945 supplies that don't seem to put out any current now.

Is there a fuse inside or something simple that I can repair? I don't see
an obvious way of opening them.

wow talk about stating the obvious, I dont mean to sound like an AHole
but this is like the 3rd time someone has brought this up on this NG
in the last week.

And it's not just "around here" the 8bits (ie 400/800/xl/xe) were
commonly referred to as "8bit Atari's" since the 80's (in magazines,
on bbs's, etc..)

Hey guys,

I know these may not be the perfect groups to ask this, but I have been dying to get my hands on a copy of Battlesphere. Now anyone who watches eBay can clearly see the prices go into the $500+ range. Now I know I'm not going to want to play this game for very long, so I feel I don't need to own it.

Therefore... I was wondering if someone could rent their copy of Battlesphere to me for a couple weeks to a month. I'd be willing to pay $20-$40 or something that's fair for this service. I imagine many jaguar owners would be willing to pay this too ;) I have references so you know you'll get it back and you know I'm good for the rental money.

I'm in the US, but that doesn't really matter much for something like this.

Thanks,
Mark

alt.atari-jaguar.discussion would probably be the best place.

$500, huh? Hrm... maybe I don't _need_ two copies.

frazzle

What am I thinking!?

Anyway... :^)

Where in the US are you? If you're anywhere near San Fran or San Jose CA,
maybe we can meet up for a round or two. :)

My 800 power pack (USA, 9 VAC) had a weird little "fuse". It was just
a small piece of PCB material, about 3/8" x 1/4" in size, with a fine
filament running across it. Not glass and no fuse holder. I can't
remember if it was installed on the primary or secondary winding of the
transformer.

My pack has been taped shut for two decades. I don't remember how I
fixed it but I shutter to think what I probably did.

Today, I would repair the break where the internal fuse is and then
install an external fuse holder.

There's no value on the internal fuse so I would pick a value for the
replacement that would be appropriate to the rating of the transformer
plus a percentage. Don't know what that value should be though.

I'm not recommending that you attempt to repair it yourself. I'm just
saying that's what I WOULD DO. (There, I've covered myself. LOL).

Can anyone recommend a general method for selecting a fuse value?

Stephen Sheppard

Hey Mark,

Get a cheap flight to the UK for the weekend 22-23 Oct, and come to
Jagfest UK. You can play Battlesphere for two days solid if you like...
;-)

Or you may be able to persuade one of the owners to part with one for
around $250 equivalent.

Coda.

I am looking to get a 256K MIO repaired, if possible. Does anyone have any
connections to someone who would be capable of this?? Any info would be
greatly appreciated. I am starting a demonstration of the origin of
computers to take to classrooms and youth centers and would like the MIO to
be a working piece of the collection I will be showing.

Those power bricks are mostly glued around the bottom and must be
broken apart for entry. Mine all had fuses inside which I
replaced with
those plastic in-line pig-tailed Radio Shack fuse holders
threaded thru
holes I put in the side of the brick. It is now accessible from
outside
with no need to break it open again.

Glad to know it worked. You'll have to clean and relube it periodically,
but that's a small inconvenience.

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

Greetings all,

Just quietly announcing the new retro mag that I'm working on...
RETRO:BYTES. It's obviously going to plug the hole left by Retro Gamer,
which sadly folded recently (unless the rumours that someone is going
to buy it and relaunch it are true. If they are, then we'll have two
dedicated magazines + gamesTM - and that would be fantastic!) Anyway,
if you want to follow the making of issue one, head over to
http://www.retro-bytes.co.uk/editorslog.rtf and there's an official
forum over at http://www.retro-trader.com/forum

A temporary web site will be up and running sometime next week over at
http://www.retro-bytes.co.uk/ - please note that this will be temporary
this time around, and, apart from the fact that I'm very busy, I'm
NOT a web designer.

Any questions or comments may be posted on the forum, or if you prefer,
you may email me... if I get the chance, I'll get back to you!

Regards,

Shaun.

I would think they would since it was one of the most popular games for the
8-bit. Along with that I would like Ball Blazer and Castle Wolfenstein.

    I just received this rather late bulletin on Computerfest in Day-
ton, Ohio, this weekend. In past years this show was usually held
in August and for a long time it was one of the biggest computer
shows in the northeast.

---------- Forwarded message ----------
Date: Fri, 9 Sep 2005 20:57:05 -0400
From: Nancy J. Christolear (njc at dmapub dot dma dot org)
Subject: [Computerfest-Announce] Computerfest this weekend

    It's that time again -- Time for the area's largest computer and
technology show at Hara Arena, Computerfest(r).

When: Saturday, September 10, 2005 from 9:00 AM to 6:00 PM and
           Sunday, September 11, 2005 from 10:00 AM to 4:00 PM
Where: Hara Area Complex, 1001 Shiloh Springs Road, Dayton, OH

    Computerfest: Still the area's largest computer fair, featuring

vendors from across the country offering the widest selection of computers, computer parts, software, and seminars available under one roof.

Dayton LANfest: Having broken all records for the largest computer gaming event in Ohio, Dayton LANFest continues to grow into one of the top computer gaming venues in the nation. This show's LAN Party will feature gaming tournaments for the PC AND X-box. Over $3,500 in prizes and giveaways will be available to the 250 plus players expected to participate. Registration is $35 in advance at www.daytonlanfest.com or $40 at the door.

Intel is offering a rare opportunity to Computerfest=AE and Dayton LANfest participants.

Need a new PC? Ever wanted to customize and build your own PC using state-of-the-art components at a great price? Then come to Computerfest, where you'll be able to purchase and build your own personal computer at the Build-Your-Own PC Workshops sponsored by Intel.

Intel will be sponsoring 3 build your own computer seminars at Computerfest=AE. Participants will be offered the opportunity to buy parts for a significant discount and then walk away from the show with a computer in hand. See full details at www.computerfest.com.

Tickets for Computerfest are $7 at the door or $5.00 at our preshow outlets. Tickets are available on line at www.computerfest.com. They may also be purchased at various locations in the Miami Valley listed on the Computerfest website. Your Saturday ticket also gets you into the show on Sunday.

Last-modified: March 25, 2005

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

    I just received this rather late bulletin on Computerfest in Dayton, Ohio, this weekend. In past years this show was usually held in August and for a long time it was one of the biggest computer shows in the northeast.

---------- Forwarded message ----------
Date: Fri, 9 Sep 2005 20:57:05 -0400
From: Nancy J. Christolear (njc at dmapub dot dma dot org)
Subject: [Computerfest-Announce] Computerfest this weekend

    It's that time again -- Time for the area's largest computer and technology show at Hara Arena, Computerfest(r).

When: Saturday, September 10, 2005 from 9:00 AM to 6:00 PM and
           Sunday, September 11, 2005 from 10:00 AM to 4:00 PM
Where: Hara Area Complex, 1001 Shiloh Springs Road, Dayton, OH

    Computerfest: Still the area's largest computer fair, featuring vendors from across the country offering the widest selection of computers, computer parts, software, and seminars available under one roof.

    Dayton LANfest: Having broken all records for the largest computer gaming event in Ohio, Dayton LANFest continues to grow into one of the top computer gaming venues in the nation. This show's LAN Party will feature gaming tournaments for the PC AND X-box. Over $3,500 in prizes and giveaways will be available to the 250 plus players expected to participate. Registration is $35 in advance at www.daytonlanfest.com or $40 at the door.

    Intel is offering a rare opportunity to Computerfest and Dayton LANfest participants.

    Need a new PC? Ever wanted to customize and build your own PC using state-of-the-art components at a great price? Then come to Computerfest, where you'll be able to purchase and build your own personal computer at the Build-Your-Own PC Workshops sponsored by Intel.

    Intel will be sponsoring 3 build your own computer seminars at Computerfest. Participants will be offered the opportunity to buy parts for a significant discount and then walk away from the show

with a computer in hand. See full details at www.computerfest.com.

    Tickets for Computerfest are $7 at the door or $5.00 at our pre-
show outlets. Tickets are available on line at www.computerfest.com.
They may also be purchased at various locations in the Miami Valley
listed on the Computerfest website. Your Saturday ticket also gets
you into the show on Sunday.
--
Computerfest Staff

I live 20 miles from Hara Arena and plan to attend mostly for seminars. I'm
confused as to why this is being posted in Atari newsgroups. Other than SCSI
drives I haven't seen anything relating to Atari for many years. It's a good
show especially the free seminars but anyone expecting Atari is going to be
disappointed. Correct me if I'm wrong.
IIRC their is an Atari show in Columbus this weekend.

   On Sat, 10 Sep 2005 at 05:23 -0000, T Shadow scribbled:
->I ... plan to attend mostly for seminars.

   The seminars are another good feature of this show.

->I'm confused as to why this is being posted in Atari newsgroups.

   Atari is a brand of computer. Atari users are computerists.
This is a large show with lots of things that are of interest to
a great many computerists. 'Nuff said.

-> ... anyone expecting Atari is going to be disappointed.

   That has been increasingly true of all computer shows and ham-
fests for more than a decade. But it isn't a good reason for
Atarians to put their heads in the sand and to try to shut out the
rest of the computer scene. There's still a lot at these shows
that's useful to us -- or at least many of us (perhaps especially
8-bitters) -- and then there's always the possibility of finding a
direct Atari item for a song.

->IIRC their is an Atari show in Columbus this weekend.

   I noticed. After all, I'm the one who posted the information
about it on this newsgroup!

this has been around for a few years now. One of the earlier models
looked alot like an Amiga 1200!   Now if they would just make a Black
and White model with silver function keys!!!

Slor,

I have written a *very* simple viewer that does what you ask.

At:

http://www.leehanken.pwp.blueyonder.co.uk/atari/ATASCIIView.zip

my apologies for the bugs e.g. lack of proper scrollbar functionality,
I didn't have much time to spend on it

Lee

Thanks Lee! If you care to share the source, I might be interested in
implementing the scrollbar/paging stuff. Feel free to contact me via
email.

This is a question for everyone who is using a Lantronix device with their
BBSs... Which settings is it that affects how baud rates are reported? I'm
using BBS Express! ST, and it always reports no baud rate, i.e., "???
baud" and I'd really like for it to report it correctly. A (very) few
games depend on the reported baud rate to work right.

Thanks everyone.

About time. Of course I remember when the PC DOS crowd was making fun of the
Atarians, Amiga people and Apple people for using a mouse.

Howdy folks

Before everybody turns on Lance, let me explain some things.

That Lance has put a lot of money into getting the rights to certain
things doesn't mean everything will be available. Hardware costs a lot
of money and not many people are willing and/or able to spend money on
Atari 8 bit stuff. Or that Lance will give people stuff, that people
have sent money for to Mike.

Stephen Carden has offered to sent people source code to stuff, so that
they can publish it. What doesn't he do so himself? And why is he
backing out, not that the going gets rough? And why are there a lot of
Atari 8 bit guru's that don't really like mr. Carden?

And if you have an old car in the back yard, that you never use, and
that's not worth much to anybody, would you not appreciate it, if
somebody asks if he or she might take it of your hands, instead of just
taking it without asking?

CU   Mathy

I have been using 8bits since 1979 (I was 9) unfortantely I sold my
last 8bit (130xe) a few years ago thinking I would never use it.
Recently I bought a 65xe to replace it but I dont have the patience or
the money to collect every cartridge for this system, so I want a
SIO2PC cable.

Where is the best place to get one? Also I dont want to spend a
fortune for something that is such a simple little device. Is there
an easy guide to making one? I do have an extra SIO cable, is there
anything I should know before buying one/making one?

Any info is appreciated! Thanks a million.

Kevin

J131, Artur Burzynski (sp?) sells a real nice cable on EBAY. Got mine
for good auction price of $10 plus I think $8 shipping and handling
(from Poland). Good quality 1-chip (14C89, I think) SIO2PC cable.
The simple circuit is built into the SIO shell, so no ugly project or
breakout box. It works well.

I had an incompatibility with an ATR8000 (a rare problem I'm told) but
Artur stands behind his work and sent me a different design, no extra
charge. However, his basic cable should be perfect for you.

I'm not sure if Artur sells direct but here is his webpage.

http://j131atari.webpark.pl/

Sidenote:

I recently started using AtariSIO (bootdisk version). Of course
wouldn't you know it, this software is not compatible with the original
2-chip MAX232, SIO2PC design, which is what Artur used for my
replacement cable.

I needed yet another new cable.

This time I decided to build my own but I'm not that handy with a
soldering iron. So, I studied the plans for the MAX232 1-chip design

but made it easier on myself by using the MAX233 chip. This meant I could leave out 4 capacitors and eliminate 4 or 8 solder points.

I didn't have a schematic to follow and the pinouts are different than those of MAX232 but the circuit is easy to build (don't laugh LLppwhite). All that I needed was some prototype board, the MAX233, a 20-pin DIP socket, 1 capacitor, 1 diode, 1 resistor, SIO half-cable, and a female DB-9 connector and shell.

My cable is pretty ugly but it works great and, as it turns out, this cable even plays nice with my ATR8000, not that I use it much anymore.

There are many varieties of SIO2PC. You'll find a few schematics below.

http://www.geocities.com/atarimods/atari.html

The 14C89, 1-chip, SIO2PC is even easier to build than my MAX233 model and the 14C89 IC costs only around $0.50 compared to $5+ for the MAX233.

Good luck on whatever you decide.

Regards,

Stephen Sheppard

Mine came from AtariMax, and I had to add the cable
to it coz theirs only is the actual SIO2PC unit, and
I haven't tried it as yet, plus no idea if it's the
14C89 or MAX233, but I'll find out soon enough.

> I had an incompatibility with an ATR8000 (a rare problem I'm told) but

I'm not sure, but isn't the 14C89 a one way chip and
you actually need an 14C88 along with it?

Again, I believe the MAX232 is a one-way design, while
MAX233 is a two direction IC.

There are a lot of serial designs that are easy to
build, and if you are handy with those things, I'd
suggest it. Helps you to know how it works, and why.

Can you use the signals from Freddie chip as if it were the Satantronic
XEGS upgrade instead? Not entirely sure what the 800XLF is either, so
how many ram chips do you have? Do you even have a Freddie
chip(CO61991)?

The number of RAM chips is 8.
Yes, I have the Freddie, but the PartNo. is CO61922.

My vote goes to Mr. Tucker. I use a Procable and Ape 1.18 and Ape for
Windpws. Excellent!

Depends, if it was my defunct 1985 VW they would be doing me a favor. If
it is one of my vintage motorcyles that I am actively working on, there
would be trouble.

People tried to explain the issues to me regarding compatibility with certain real hardware but it goes right over my head. Something about tri-state.

As for MAX232 vs MAX233 they both do the same exact function just MAX233 has integrated capacitors while MAX232 does not. Both IC's have dual transmit/receive units.

At the link I listed you'll see a couple of single chip designs including the 14C89. No you don't need another chip.

I would have given Steve Tucker a free plug, just based solely on the reputation of his products, but I can see that he capable of doing it himself :) Shameless!   (Just kidding Steve!)

Stephen Sheppard

You can download the SIO2PC program for free and it works fine. But I would
spend the money and get APE. It is well worth the money and more. I have
used both and it's no contest. You can do so much more with APE.

I recently was following some links looking for an SIO2PC interface or
some easy directions to build one and I came across an 800xl and 130xe
that had a built in SIO2PC with just a serial port sticking out the
back.   IMO this is cool as hell, anyone know how this is done? Anyone
do it?

Same basic way you make an external cable, but instead of attaching to the
wires in a SIO cable, you solder it right to the connector inside the
machine. Mount a DB9 on the back of the case.

I have the SIO2PC from AtariMax and just purchased the software not to
long ago. No comparison to even the free version. So much more added
for capabilities! And he always improves on it. You will need an SIO
cable, but usually comes with the 9 pin serial cable.

The only problem I had with it, is that I needed to have the Atari
computer plugged in and turned on to properly feed enough power to the
SIO2PC adapter. But works slick!

Hi,

May be my questions are stupid but if someone can help me to
understand the differences between the Atarimax products :

Atarimax MyIDE+Flash IDE :
If I understand well, with this card, i will be able to connect an old
IDE HD. But what is the function of the flash component in this case ?

Atarimax FLASH Carts :
In this case, I don't understand !
How does it works, can i put some software from ATR (on my pc) to the
cart and how ?

Atarimax/ABBUC USB Cart :
I understand it's a product to interface some USB components to make
backup for example (but does someone tried to make an other
application ?)

Thanks by advance, I'have an old 800XL and these products are very
nice.

Not yet but as my SIO and SIO2PC cables keep falling out of my 800XL I
was thinking about doing an internal interface.

Patrick's Atari 8-bit Mods site has a couple of good examples. Take a
look.

http://www.fonck.nl/atari/

Patrick put his SIO2PC interfaces inside an 800XE and a 600XL. One
uses a DB9 connector and one uses a PS/2 style connector. Both use a
1489 chip.

I was thinking about using an RJ45 connector for mine.

Anybody able to pick up a couple for me? I am located in Norway and has no
access to Wal-Mart. Also would like the second Flashback. I'll PayPal money
for shipping and a little for the effort.

Take Atarian care

I've seen the Atari Flashback (not sure which version) in shops here in
the Netherlands. IIRC it was a shop called "kruidvat". But it's been a
while. Guess that means you don't have to find a Wal-Mart to find a
FlashBack.

CU   Mathy

PS it came in a red box, with joysticks that looked like they would be
used on the 8 bit Atari.

I could do this for you. Purchase of 2 items would
be $46.00 to me, then $29.00 shipping to you, plus
a little for my effort. The total for just getting
the items to you is $75.00 USD, and $10.00 for my
services. A total of $85.00. Let me know by emailing
me at the reply to sender address. It is not munged.

Thanks,

Bill Garber

This has gone completely beyond that IMO. I am probably the #1 advocate
of intellectual property rights in the group. Lance does have some
rights, just not the blanket ones he claims. I was kind of offended in a
way I haven't been since the Derek 'you are all thieves' tirades.

It's more like Lance is saying ~I had some work done on SD so now I own
all the rights to that version and then fires off a preemptive threat.
What he would own the rights to is the added code. He can argue you have
to remove his code from that version of SD, but that is it.

Another car analogy, I let you use my car, you put an new air filter on
it and say you now own it.

The funny part is that this 'car' in question has less value then my
busted VW: A derivative work of a freeware OS for use with an obsolete
concept, the bbs. I only mention this because there are still people
with valid business models out there for making at least enough money to
cover their Atari habit. Ape for Windows, Atarimax, SIO2PC cable makers,
etcetera come to mind for a way to advance the art and make a couple of
buck$.

You can download the manual from the site for nothing. I have a real Atari8
setup (800XL,floppy drive, Supra hard drive and Commodore monitor) another
130XE hooked to a PC using APE. For transferring files from one to another
it can't be beat. You can download Atari8 files from the internet on your PC
and then convert them to use with APE or a standalone Atari8 setup. It has
all these functions built in and the tech support is great!

I got mine on Ebay, but I have seen some Atari sites in Europe (especially
Germany) that sell them.

Its too bad they arent a '800 on a FPGA' like the DTV-64 is for the C64.

It would be great to have a '800 on a board the size of a playing card.

dv <dvmicro@nordnet.fr>:

>May be my questions are stupid but if someone can help me to
>understand the differences between the Atarimax products :

Steve Tucker would have the definitive answers, but since he hasn't
answered yet, I'll give you some info since I own all three of these.

>Atarimax MyIDE+Flash IDE :
>If I understand well, with this card, i will be able to connect an old
>IDE HD. But what is the function of the flash component in this case ?

The flash component is for storing programs that you would like ready
access to (such as programs that people have written for MyIDE or sector
copiers, games, etc...) It's writable again and again, so use your
imagination and come up with some set of utilities where having access to
them almost instantly makes your Atari experience better.

>Atarimax FLASH Carts :
>In this case, I don't understand !
>How does it works, can i put some software from ATR (on my pc) to the
>cart and how ?

Yes, exactly like that. Steve's done an excellent job at making a perl
script that will build a "flasher" disk for your Atari that lets you put a
ton of binary file games/programs, entire ATR games, even multi-disk ATR
games (this requires some light programming work). There are images that
will run Ultima IV, Ultima III, Conan, Summer Games, etc.. from cartridge.
I'm putting the finishing touches on a Ultima II flash cart that I hope to
release sometime soon as well. You can even save your game to cartridge!

Next to the SIO2PC cable, these things are the best thing that has happened
to the Atari 8-bit in recent years IMO.

>Atarimax/ABBUC USB Cart :
>I understand it's a product to interface some USB components to make
>backup for example (but does someone tried to make an other
>application ?)

I have one of these, but haven't done much with it yet. The problem is
that drivers are still in development. A mass-storage driver is still some
time away, AFAIK. Still, it's very cool to hook up a USB device to your
Atari! If I remember correctly, there has been some games release that are
patched to work with various USB devices, such as steering wheels,
joysticks, etc.. even a USB keyboard driver.

I was going to suggest that your number for freddie would make sense
being that it is a PAL Freddie where mine is a NTSC Freddie, but
looking at Jindroush's site that you posted he shows a PAL XEGS with
the 'NTSC' Freddie? Prolly just a boo-boo there?

OK then, motherboard wise, yours would be the same 'type' as an older
65XE which means you need to wire in a CO25953 chip to split Freddie's
CAS signal into two CAS lines, one for main memory and one for the
extended memory that you'll be adding. I would think this extra work

required would best be avoided by using a 130XE to start with instead
of the 800XLF you are talking about doing. But if it's the only one
you got and you want it badly enough, I suppose one could piggy-back
the CO25953 somewhere onto another chip and then hook up all those
traces by wire that you don't have on your board. In other words, you
first have to make your 800XLF into a 130XE for the most part and then
apply the satantronic stuff on top of that. Best Electronics would
have the CO25953 chip but you are on the wrong side of the pond for
cheap shipping, I just tried his web site and it's down??? Hope it
comes back online soon.
http://www.best-electronics-ca.com/

You'll need a 130XE schematic to see how to add in the CO25953 chip and
wire it correctly, wouldn't hurt to have a 65XE schematic either.
Don't be too surprised to find that the 65XE numbers for resistors,
etc. match those on your board, the same is pretty much true between
800XL and 130XE too.

I wouldn't been suprised if that happens... I've heard several people
mention that they are working on projects like that.

Those CF to IDE adapters are great. I have used them in PCs,
and I plan to use one in my server for my 8-bits if and when
I ever get the time and space to set them up. Serial to the
Atari and parallel to the C64. Should prove to be interesting
at the very least.

Random question, well sort of anyways:
I did see this project on a web page that I was looking at however at
one point it states that the cartridge is for "any" 8 bit atari, however
further down the page it entitles it something like XL/XE cartidge.

My question is would this thing work in a 48k 800? (Also, I saw a USB
adapter on the same page, any idea if that would work in an 800?)

(I've been digging out my old systems recently, Atari 520ST, IIGS, //c,
and the 800. I've had all the others runnning except for the 800 so
far, and my floppies seem to have held up rather well, i.e. no dead
disks found yet, but I haven't really extensively tested them. All the
hardware is up and running as well, excepting for a cranky IB 40 drive

for the ST which is refusing to write disks, yet it will read and format them... Need to clean it I suppose, but I recall that it was a cranky drive even when new, and the SF314 is still kicking fine. The 800, well I've powered up the 810 drive which seems ok, but I've yet to hook everything together and see if it still actually works. Sorting out disks from all the systems is keeping me busy, as I never bothered to label many of the disks, they're mixed together, etc. along with dealing with the trials and tribulations of transferring software which is only going to get worse as the 800 has zip in the way of connectability with any other system at the moment, hence my interest in these cartridges, and actually the USB one if the FDI works, then I could probably use my USB zip drive and some ingenuity from linux and images or a compact flash adapter... My only real regret is that I did not get these machines out years ago when old SCSI adapter and the like were available cheap, i.e. the old commercial mass produced adapters...)

Trivia: I did find the instruction sheet for the 32k memory board that I added to the 800 many many many years ago, IIRC it was an Intec 32k board(I think I also recall the packaging originally may have said Mosaic 32k or something of the sort), and IIRC it cost me a ton at the time, many months of allowance and grass cutting profits...)

The MyIDE makes a nice setup. Here's a couple of other possibilities
FWIW. I've used the CompactFlash with an (ebay) IDE adapter. It works
fine, but as has been brought up before, flash memory is not long-lived
with repetitive writes. Most (all?) have built-in error checking
routines and some spare cells to compensate. But my mainstay for both
the KMK/JZ and MyIDE interfaces is a 2.5" notebook drive housed in one
of those "shirt pocket"-fitting USB cases. Notebook drives can use as
little as 0.5 amp at 5 VDC. So if you have a good PS for an XL/XE,

you can power the drive with no additional PS. My XE uses a 5 VDC, 4 amp regulated switcher, so I have plenty of "juice." I haven't made a permanent connection for the drive yet -- maybe this winter. A neat thing about the KMK/JZ is that it is housed in a nice case, and a 2.5" drive/case will sit right on top of it, using a 3" IDE ribbon connector. It even works out so that the drive is "right-side up." That used to be a big deal, but I've actually seen 3.5" drives that were factory mounted upside down. (Upside down still seems suspect to me.) BTW, at the last report, the KMK/JZ interface still does not work with XL's since it uses the ECI instead of the PBI.

Has anyone (other than the USB team) tried this? I'd like to compare notes with any other USB users. I have the cart, USB floppy, and USB ZIP drive.

You can use the RTCLOCK to count the jiffies (screen refreshes), and you
can use VCOUNT to determine which scan line you're on. Is there a
reference that will tell me how to convert those two values into a precise
time?

I suppose I could write a tight assembly loop to watch for VCOUNT to
change, and then count the cycles until it changes again. I could then do
the same for the time from when RTCLOCK changes to when VCOUNT changes.

But if this has been done already, please point me to the documentation.

Also, is RTCLOCK really 1/60th of a second on NTSC, or is it 1/59.94th of
a second?

The MyIDE cart that I have, from Atarimax, I think only works with XL/XE.
It uses RAM under the OS, so it can't run some software, including
TurboBASIC XL, which is a shame... I like TurboBASIC XL. :^)

The original Mr. Atari design might work with an 800.

Guh... I'm not 100% sure of any of this, actually. Hopefully someone who's
actually _familiar_ with all this stuff will answer. I'm a total newbie. ;)

All this is derived directly from the video timing. The video timing,
again, is derived directly from the crystal oscillators in the Atari.

NTSC machines use 3.579545MHz crystals. A scanline is 228 color clocks,
which is 3.579545MHz/228 ~= 15.6998kHz. Since VCOUNT is increased
every second scanline, the time between changes is 127.39uSecs.

A full NTSC frame consists of 525 lines. One field is 262 lines, the
other 263 lines. But the ANTIC outputs two fields with 262 lines
each (and doesn't care about interlacing). This means
RTCLOCK is updated 59.92 times per second (that is 16.688msec).

Search for ANTIC.PDF with xlsearch and have a look at page 4
(this is where I got my information from).

BTW: On PAL machines the crystal is 3.546894MHz and a frame consists
of 625 lines.

so long,

Hias

Hi from Italy !
I'm an collector and I've one Atari 65XL that had some problem with screen
(goes blank after turn on it).
I'm searching for a Service Manual...

May someone help me ??

Thanks in advance

Massimiliano

thanks for the reply. I was sort of guessing that the IDE cart might need
64k or more to work, as I suspected that the driver, plus maybe some
buffer space would use some RAM. 48k is pretty bare, but it'll run
everything I needed from the 8 bits.

I looked, I think, at the atarimax page again yesterday, and it looked
like the USB cart should be for any 8 bit, as it says that in several
places. I just wonder how much memory that would take away from my 48k,
but it should solve my software transfer problem. (I do have an old 835
300baud modem that I could use in a pinch, but I doubt the usefulness of
that route... Incidentally, I opened it up the other day and was
surprised to find the board EXTREMELY simple, and bearing a Racal Vadic
copyright, and, alas, no simple RS-232 interface as I had hoped(maybe I
can hack it though...). They used to make some of the best modems...)

Maybe I'll have to track down a way to add some more memory to the 800, or
get lucky and find a 130xe or 800xl or XF551 or similar in some garage
sale or thrift shop. (I plan on looking any ways, as I'm hoping to find a
hd interface card for the IIgs, and maybe an amiga, mega STE,
falcon, and/or TT(I wish...), and a hd interface for that as well...)

I got your lawyer letter but you and your lawyer made a few mistakes,
look here:

http://tinyurl.com/dg5w4

where did i specify SpartaDOS 3.3?
where did i specify BBS Express Professional?

did i not state all non fte products which would mean those not
developed or created by K-Products or even Stephen Carden?

that bill of sale from Bob Klaas to you does not specify any icd source
code but only source code produced by Keith Ledbetter, Chris King, and
later Stephen Carden; in fact, this bill of sale from Bob Klaas to you
only specifies BBS Express Professional (and all source code) it does
not inlcude SpartaDOS 3.3 (for which I have never stated an interest
in) or anyother icd or even fte products; instead the last line of the
paragraph in bold reads: "including all copyrights to any soruce code I
Robert Klaas have to BBS Express! Professional and submit."

your lawyer also states it was his understanding that Robert Klaas had
previously contracted with Mike Hohman of FTE to produce SpartaDOS 3.3
for BBS Express Professional; this agreement between Bob and Mike did
not relinquish Mike's ownership of any icd or fte products. The only
thing Bob had ownership of was his own source code and bbs express
professional.

in regards to icd or fte products, you still have not provided any
proof that you own anything other than bbs express professional.

i will be having an intellectual property lawyer look at the documents
from you and your lawyer.

since i am now rarely online i will post again as soon as i find out
some more information.

yea, I have USB cart and USB floppy. tried them but results weren't to
promising. smae with the usb keyboard I tried. does not even see it in
the usbtest program. for that matter, any USB keyboard I tried and I
tried 4 different ones. so as far as USB goes on Atari, it is less
then useless at present. I do hope the USB team makes progress tho.

I have been using Spartados (32g) for a little while now and have hit a roadblock. I can't seem to change directories (back or forward). I can if I use the Menu shell. (menu.com). The "CWD" command should do this but doesn't. I'm an old MSDOS user and am still familiar with the command line. I have tried every way possible-like: D1:CWD>DOSUTIL OR D1:CWD >DOSUTIL OR D1:>CWD DOSUTIL. I have a Supra hard drive setup using Spartados and it won't work there or on single floppy disks. I have an ATR with Spartados on it from Steven Tucker (APE) with a subdirectory on it and it won't work there either. What am I doing wrong?

<snip>

Also, in case anyone cares:

5.25" drives require a longer seek time than the 3ms default of TOS(or at
least the v1.0 that I have with my 520ST). I had forgotten about this,
but while digging around for drivers for the IB 40 drive I came across an
article by Dave Small re: adding 5.25" IBM drives to an atari, along with
commentary about how someone else said that they needed a longer seek time
than the default. From this info I dug up a lharc archive containing the
original article by D. Small the additional commentary, several utilities,
and the most important one of all, one that resets drive b seek time to
6ms. End of story: the 5.25" drive appears to be working fine again.

(The odd thing is that the only driver disk from IB Computers that I can

find right now, only has a formatting program, so I must've lost another disk somewhere as I'm sure that they'd have shipped a similar utility, and in fact I think that I vaguely recall having an auto folder program to do the same thing, and forgot about it all those years ago as well... I suppose that I should also dump this into the ST newsgroup... gack crossposting... hope this helps someone else some time...)

My 800 died Saturday after nearly 25 years of flawless operation (besides a space bar repair and non-Atari memory failure). I opened up the cartridge door, pulled out the cartridge, and closed the door. Only the power didn't come back on. No light or anything.

I took it all apart, cleaned off all the dust (there wasn't much), and pressed down on any chips that weren't fully seated (one was working loose, but I don't think it was a problem yet). I used a multimeter on the opposite side of the switch to check that it isn't broken. I tried a different power supply.

What can I try now?

If I disconnect the power board from the rest of the system, is it safe to apply power? If it's working correctly, will the LEDs light up without

the main board attached?

And by the way, what's that connector in the back of the main board? I'm guessing it was used in the factory to test the board; does it have any practical use?

Try using the 'CD' instead of 'CWD'. Some later version of SDOS had that changed.

Thomas

Open it up and look at the ram chips. If they are the 'MT' type ram chips I would start there with replacing those.

Hey Ziggy - I believe I have things arranged with this generous soul. It's
possible I'll have some extras though once I've gone through everything, so
I can give you a holler if you're in the area. Feel free to drop me a line
directly.

Yup. I suspected that. It still clicks like normal, and when apart,
I can see the contacts working. I verified the electrical action
with my multimeter.

I don't know where you're talking applying power.
I would generally say no, don't apply power yourself.
I can't remember, but I think, as you mention, there's a
power board, a main board, then the three types of plug-in
boards at the back of the main board. That edge connector
at the back was, I think like you say, for manufacture testing..

The nice thing about the 800 is its' modular design. All you need
are some known good working boards and you can isolate the
problem a great deal. I suspect your power board, since no
LED light comes on. Not much help. I have a complete set
of extra boards that could be used for such testing. Maybe you
could invest in a second 800.

That's right, but with the MyIDE-OS burned on EPROM, most of that stuff
will work just fine. SpartaDOS v3.3 works with MyIDE for instance. The
news (as far as I know it) is that Sijmen (Mr. Atari) is working on
debuggin a version 4.0 of the EPROM based OS. The newest versions of the
MyIDE OS are awesome. Sijmen's put a lot of work into them.

The MyIDE flashcart is your normal MyIDE adapter plus a 1MB flash
cartridge, so it can be used with the old 3.1 version of the MyIDE OS.
This version has a bug that can corrupt your partitions though. (copying
from one MyIDE partition to another causes it.)

>The original Mr. Atari design might work with an 800.

As far as I know, only one MyIDE was made for the 800, and it's in the
possession of Dr. Clu. The production MyIDE adapter won't work with the
800.

Sijmen will have the definitive answers to your questions, of course.

Shawn Jefferson

Is the MyIDE-OS-on-EPROM compatible with the hardware (the Atarimax MyIDE
plus flash disk cartridge) that I have? :^)

I saw that mentioned around here earlier. I'll try to remember not to do
that. :^) I'm still a little confused as to how partitions work, and it
took me a while to realize that the whole "Start + Reset" 'image' interface
had nothing to do with D1:/D2:/etc. drives. :^)

Someone needs to put together a _newbie_ howto. :^) In the meantime, I'm
muddling through the current docs well enough, though.

Thx!

    Yes, if you have the MyIDE 3.1i OS rom switched in, the cartridge will
  use that instead of replacing it with the MyIDE RAM OS. Having it in ROM
  will work much better for things like loading games.

Hi,

I have recently acquired an Atari 130XE and a 1050 disk. Unfortunately I
do not have a dosk diskette. Is there someone available to send in Italy
a copy of a DOS disk?

Thank you
Alfredo

Hi iMac, what's the weather outside? Maybe you should stop surfing the

60+ channels of your cable and explore the real world.

I have a small Sony television from the days of the C64. Back then, I
needed a small TV with a Scart connection. I only watch telly once in
a while so I don't care about size and stuff.

Actually, I'm not sure how many programs I could receive. At most 15
of them are of interest anyway. (I don't need a homeshopping channel
and there are too many stupid people on the street - why should I watch
them talking on TV?).

And: It would be cool to use such an old device as the ITT TV2466.

Uli

If nobody mails you a disk, you can make a SIO2PC cable and boot the
Atari off a PC with your real disk jumpered as drive 2. Format and write
DOS files to the real drive and you can then switch it to drive 1 and
use it to boot.

I'd be happy to send you a couple of DOS'es. What's your address? And do you have any preferences? DOS 2.5 is a must in my opinion, MyDOS 4.53, a Sparta DOS and I can't help it, I like DOS 2.6f. Let me know and I'll send it to you!

Take Atarian care

...as a side note, there was apparently only a single disk included with
the IB drive. It contained at auto folder with the res.prg program, and a
disk formatter. I learned by trawling through the STart magazine archives
on atari-archive.org that the res.prg MUST be the FIRST program in the
AUTO folder, and also, that, apparently, it REQUIRES a disk in the IB
drive. The last part seems to be false as I did a quick experiment, and
it seemed to still work when booted without a disk in the drive. I also
recall that I must have had problems with this driver (changes seek rate)
in the past.

The other program that I had was called dseek.prg and it changes the seek
rate for drive B to 6ms. I obtained this program from the umich ST
archive, Disk(IIRC) folder contained in the ibmdrive.lzh archive. This
archive also contained the previously referenced articles by Dave Small
and others about adding IBM drives to an ST and the necessity to increase
seek time for 5.25" disks.

All of this was tested on a 1M upgraded 520ST, TOS
1.0, no other upgrades or hacks. The drive is the IB40, or the 40 track
version of their 5.25" drives, and was hooked up to a standard SF314 DSDD
drive. I'd presume that there are other utilities out there that will do
the same, but in my quick search this was the best that I could turn up,
and it would seem that using the dseek.prg is the most reliable way to go
at this time.

Thanks for the reply. It's as much as I had surmised from the
advertisement page.

Any idea about the USB cart though? That page even to the end seems to
support it's "for any Atari 8bit"(or similar) listing...

I suppose in the mean time, I'll look out for some XL/XEs around, or at
least some extra SIO cables to hackup for serial support, as this all
started with a desire to rescue my oldest personal data from cassettes &

floppies, along with a game of Universe perhaps on the real thing.
(Devolved from originally just wanting to play a game of Universe, but the
emulators didn't do a very good job on linux or OSX, or the disk images
weren't quite good enough.)

While I'm also thinking of it, do either of you happen to know if someone
found some modern connectors that can be made to work with SIO ports? I'd
been kind of thinking maybe some older automotive molex connectors or
similar maybe, but don't have anything handy to try sizewise. (The only
info I've seen to date was something about someone else had written they
couldn't find anything suitable and recomended sacrificing a genuine SIO
cable, adding the circuit "board" and appropriate DB-25 or 9...)

thanks

I'll try to get the disk out asap. Any other items you'd like? Are you going
to program it, play it or what?

Take care

Hi, I am in the UK but visiting Italy next week, if you let me know what
version you would like and your address, I will bring a disk and post it
locally.

It was one of Atari's best kept secrets; I seem to recall an article in
ANALOG (I think) about it being an expansion connector similar to that on
the XL/XE's. Not fully compatible, of course.

the connector on the 400/800's is not for expansion like the PBI/ECI
on the XL/XE's it was merely for testing those computers. There is
nothing secret about it.

    Its included in the 32-in-1 OS upgrade here:

http://www.atarimax.com/warpos/

    Or you can download it from Mr. Atari's web page and burn yourself a copy
  onto a 27128 EPROM, which you can just put into the OS ROM socket. :)

I think to use it to do some BASIC programming and of course some
playing (I have also a couple of cartridge). If you can add some games
on the disk I woulde be grateful.

Ciao
Alfredo

On Wed, 7 Sep 2005 18:02:58 -0400, "Michael Duffy" <mqduffy@comcast.net> wrote:

This text file might be helpful/interesting, it came with the original distributions of 3.2g.

(I grabbed it from the archive of the Cleveland Free-Net Atari SIG at http://www.atariarchives.org/cfn/12/03/0051.php , where I see I originally posted it 11 years ago(!)).

-Michael

What's new in SpartaDOS version 3.2g

****

Version 3.2f could only access drive
ID numbers from D1-D8. Now, you can
access drive D9.

****

A filespec that does not contain a
drive number, such as D:TEST, will
now default to your currently logged
drive on the command line.

For example, if you are logged to D4:
a filespec of D:TEST will be converted
to D4:TEST, instead of D1:TEST as it
used to be. This change can be very
useful when running programs from
different drive numbers, since you
can access files with D: and they
will automatically be taken from
whichever drive the program was
was started from.

You must now be careful however, to
always type D1: when you need to
access drive 1 specifically.

****

A file will no longer be destroyed
when copying it to itself. The DOS

checks for this condition, and will
report a 'File exists' error.

Commands such as:

 D4:COPY D4:TEST

will no longer destroy the file TEST.

****

All command line input, including all
commands, files, and drive IDs, can
now be entered in either lower case or
upper case. Lower case was only
partially supported in version 3.2f.

****

Some commands have been changed, to
make them more compatible with the X
cartridge, as well as making them
easier to type. The following changes
have been made:

CWD has been changed to CD.

CREDIR is now MD (Make Directory).

DELDIR is now RD (Remove Directory).

Note that with the Remove Directory
function now called RD, the RD.COM
ramdisk handler needs to be renamed
to RM.COM in order for it to work.

(This will be the name of the MARS8
 compatible driver to be released.)

****

There are many additional error
messages, so you should no longer see
error numbers on the command line.

****

A system lock-up bug has been fixed,
when the clock wraps from 12-31-1999
to the year 2000.

Also, the day of the week offset
has been corrected for years after

2000, in the new TDLINE program.

We are 5 1/2 years 'ahead of time'<g>

****

Program files containing a RUNAD, can now be reentered with the RUN command after returning to DOS. The normal process of saving the starting address for a .COM file into Sparta's internal variables, was disrupted when the file contained a RUNAD address. This has now been fixed, so all program files will behave the same way, whether or not they include the RUNAD address.

****

Several changes have been made to the keyboard buffering routines. When holding a key down for auto-repeat, the buffer will not fill up with excess characters that the application program hasn't used yet. There will at most, be one additional character in the buffer during a key repeat.

This means that when you release a key, the repeat process stops right away, whereas there could have been many additional keycodes 'stacked up' when using version 3.2f.

The key combination Shift-Control-Esc can be used to clear all of the keys currently stored in the buffer. This gives you a way to cancel everything in the buffer when a situation may require you to abort.

****

The 1200XL key functions such as DMA off, keyclick toggle, and keyboard lock, now work properly.

****

The key buffer NOW DEFAULTS to OFF due to incompatabilities with certain programs. It can always be activated as part of a STARTUP.BAT file using

'key on' (even in lower case), if you would like this feature enabled.

****

The AINIT command was removed from the command line. However, the XIO Atari format function can still be used within application programs.

****

Even with all these changes, the DOS file size has been reduced by 260 bytes, and the lomem has been dropped 119 bytes. If you do not have a PBI device, your lomem will be at $17A2.

Users with a PBI device will find their lomem at $1BA2, since the buffer space uses 1K at lomem, instead of the $D800 PBI area.

****

FTe has decided to release a special 3.2 'gx' version that can bring memlo back down to $17A2, by placing the disk buffers under the OS at $C400. This has an added benefit of using a full 2K of buffer space, instead of the 1K space allocated at memlo, and will help the DOS run faster.

However, SpartaDOS 3.2 'gx' is NOT COMPATIBLE with BASIC XE, or any other programs using the RAM under the OS from $C400-$CBFF. It is provided for those users who don't require this compatibility, and who would like to have the additional RAM available.

NOTE that if you ARE NOT using a PBI device, (such as an MIO or Black Box) you do not need the special 'gx' version, and will already get the 2K buffer space and $17A2 lomem with using the STANDARD 3.2g version.

****

SpartaDOS 3.2g and 3.2gx are being

released as Shareware on an AS-IS
basis. If you do happen to discover
any incompatibilites, please don't
hesitate to let us know, so that we
might be able to fix the problem
in any future revisions.

This upgrade was made possible by
everyone out there who took the time
to register 3.2f Thank You!

****

If you like what you see, you may
register 3.2g by sending $19.95 to

     Fine Tooned Engineering

          PO Box 66109

       Scotts Valley, CA

                    95067

This will get you all 3 manuals in
addition to the SpartaDOS Toolkit.

****

Hmmmm??? Well if you cannot do anything at your end, I would send it in to
either B&C Computers or Best Electronics. They will fix it.

> to unsap with?

It's me again.
Lets begin convert example sap file. Open windows command prompt (run cmd for
example) and enter:
perl unsap.pl sapmaker_sap_file.sap

Here is an example.
Try convert Reksio_Theme.sap (made by Sapmaker tool) from ASMA Archive
http://asma.atari.org/.

```
C:\UNSAP>perl unsap.pl Reksio_Theme.sap
Reksio_Theme.sap -> Reksio_Theme.d15: OK
Reksio_Theme.sap -> Reksio_Theme.md1: OK
```

Thats all !

Good luck !

> example) and enter:
> perl unsap.pl sapmaker_sap_file.sap

That's where it fails for me. It doesn't recognize perl as a valid command.
So, I guess I might have downloaded the wrong files?
These are the files I downloaded. I run on, dare I say it, MS Windows 2000.
ActivePerl-5.8.7.813-MSWin32-x86-148120.zip
TD125CC9EF-ASPNPET-9BB0.exe
and the UNZAP.ZIP file containing the one file UNSAP.PL

> Here is an example.

>
> Thats all !
>
> Good luck !
Thanks, that's the way I did try it, but due to the perl not being a valid
command, it doesn't do anything

I appreciate the help! Take Atarian care

BTW : Any of Gilbertsons pieces on SAP files? Alternate Reality : The City
is fabulous, as well as Passionately. One of the reasons my Atari is still
running and the XBox is put aside. ;-)

Check your PATH environment variable. It should contain a path to the perl
command (c:\Perl\bin as default).

Forgive me, but circuits have always been difficult for me. I'm easily
confused by the little details.

You mentioned wiring 3 pins to switches but earlier you said you used
two switches, one being DPDT. Does it matter which two pins get the
DPDT switch.

You also mentioned pull-up resistors. What values? Where do they
connect? in series with the switches?

You indicated pins 2, 3, and 29 of the flash connect to the switches.
Where do the other ends of the switches go?

Stephen Sheppard

What country do you live in Uli? Personally, I have never seen a TV
that only supported 8 channels. I know that some of the old NTSC
(North American) televisions had dials that offered 12 channels (2-13)
on the VHF band and a whole plethora of channels on the UHF band.

Regardless, I'm intrigued to learn that your cable company offers only
20 ("twenty") television channels to its subscribers. Locally, Canada,
our cable company offers more than 60 ("sixty") channels as part of the
basic analog package and a couple hundred others as part of the extended
digital package. If I recall correctly, there is no redundancy with the
analog and digital cable packages.

My best advice to you, Uli, is to get a satellite dish if you're really
serious about getting some variety in your television programming.

If you really want to learn some Assembly programming by looking at
other people's work, might I suggest that you get your hands on a
disassembler and disassemble some compiled code? You won't get any
programmer comments by perusing disassembled code, but that's the whole
point. You get to try to figure it out for yourself.

When I want to teach myself something, I try to understand the work of
others without being lead by the hand through copious amounts of
programmer comments. If I can't figure it out on my own, then I ask
questions.

You'll probably find that looking at undocumented code is much more
stimulating and educational.

I agree. If you notice some of my other recent posts looking for
disassemblers and subsequent involvement bringing Dis6502 back to life,
you'll see I'm doing just that. I guess I'm really trying to hit from 3
angles: disassembled code, nicely written code that is freely available,
and all the books I can get my hands on.

Given the cyclic nature of my time put into learning, I expect to have
something of my own worth releasing by the 800's 50th birthday. :)

If ActivePerl didn't have an installer, typically setup.exe, windoze
probably doesn't know where or what perl is. Also the perl interpreter
may be called something else.

You'll have to give the entire pathname to perl, e.g. c:\some folder1\some
folder2\etc\perl.exe then as suggested. (This also may not work as
activeperl may be expecting some shell variables to be defined, which
won't be, e.g. something telling it the path to it's location and where
the support perl scripts are located...)

There should've been some documentation files in that active perl archive
as well, if there was no setup.exe telling you how to setup the activeperl

environment. (This is as good as I can do, as it has been years since I've
bothered with activeperl, and it just worked for me back then...)

> connect? in series with the switches?
>
> You indicated pins 2, 3, and 29 of the flash connect to the switches.
> Where do the other ends of the switches go?

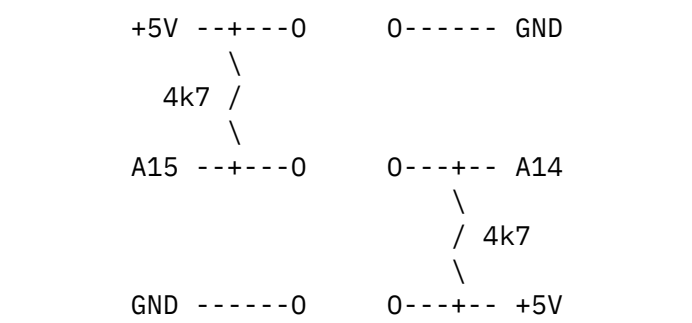
The easiest solution is to use 3 SPDT switches. Connect the middle
pin of each switch to one of the address lines of the flash
(pins 2/3/29), connect one outer pin of each switch to +5V and the

other outer pin to GND. With such a setup you can control all of the "higher" address lines and use the complete 128k flash.

My solution (with a SPDT switch and a DPDT switch with neutral position) looks like this:

Pin 2 of the flash (A16) is connected to the middle pin of the SPDT switch, the other 2 pins of this switch are connected to +5V and GND (just like in the first description). With this switch you can select either the first 64k bank of the flash or the second bank.

The wiring diagram for the DPDT switch and flash pins 3 and 29 looks like this (this is a look directly at the pins of the DPDT switch).



A15 is pin 3 of the flash, A14 is pin 29 of the flash.

Now let's see what happens with A15 and A14 in the various positions of the switch:

If you set the switch to the upper position, the two lower pins of the switch are connected to the middle pins. This means, A15 is connected to GND (low) and A14 to +5V (high).

In the neutral middle position of the switch, the middle pins aren't connected to anything. The pull-up resistors now pull A15 and A14 both to +5V (high).

In the lower position, A15 is connected to +5V (high) and A14 to GND (low).

So, we can generate the following address patterns:

pos	A15	A14	16k bank number (1-4)
UP	0	1	2
MID	1	1	4
LO	1	0	3

The first 16k bank cannot be selected with such a setup. But that was OK for me. You also have to keep the bank ordering in mind when you program the flash ROM. The first 16k block is empty, the second block is for the "UP" position, the third block for the "LOW" position and the fourth block for the "MID" position. A little bit confusing at first, but quite comfortable once you are used to it.

In my computer I ordered the ROM images in such a way that the
SPDT switch selects between "old" (Atari 800 compatible) and
"new" (XL/XE compatible) ROMs. With the DPDT switch I can select
between 3 different ROMs in each group. That's easier to remember
than having 3 SPDT switches.

so long,

Hias

You know I have posted code to this forum only to be blasted by frigging
mental midgets as being a fraud and not actually knowing how to program.
I don't feel like I was picked out for abuse so much as it is SOP for
some jerks to pick apart other peoples' code while they produce nothing
and volunteer nothing.

I seem to recall Bob Puff gave the same reason as one of his multiple
reasons for not including source code with things like BobTerm. Letting
people see your source is like putting a bullseye on your buttocks. If
you so much as waste a single cycle in 10k of source code for the sake
of clarity some moron will jump off the wall to chastize you about how
much smarter they are then you and how you are doing a disservice by
posting bad code.

Let them think they're smarter. You are more clever, since you make things
and they don't. I don't care if people slam my code, but I am open to
suggestions for making it better. It's more of the way things being done I
think. What have you made, BTW? I am curious to hear if somebody still does
some coding around here. I am planning to start a new RPG, and was thinking
of MUX, but have no info on it and no access to one. Also thinking of the
USB cart connected to two Atari's, don't know if a HUB would do it for more
players. Have you, Slor, started anything yet? Feel like sharing?

Take Atarian care

Ah, now I get it!

That's the kind of extra help a nOOb like me needs!!!

Thanks Hias.

Regards,

Stephen Sheppard

Probably the things I have been involved in most are screen routines of
one type or another: Started off with 80 column terms back in the 80's.

Did a lot of things surrounding JS ports. Everything from initializing
an attached Ham radio's frequency to RS232 to ~300 Watts of 120 VAC
switching.

There was my 1489 redesign of SIO2PC which was popular of course but I
never wrote a single line of code for SIO2PC or APE. Come to think of it
I did get a ton of negative response about it being a hack and not
following RS232 standards from people that never read the RS232 standard.

I did a whole slew of routines for someone who wanted to come out with
an 8bit WYSIWYG pulishing software. Most of it was pretty pedestrian,
things like shrinking images and expanding them, combining them with
different logical operators. There's probably a disk decaying in my
basement with those routines on them. The guy I did them for never got
back to me other then to say I didn't do routines to accept things other
then divide and multiple by 2 or 3. I wrote back ~'If you want an image
1.5 times as big, use the multiply by 3 routine followed by the divide
by 2 routine.' I never heard another word since. I don't think he liked
that answer. The code was rather bloated in that I used look up tables
but I don't think it could have been faster.

The only thing left undone that I am still sort'a interested in was the
beginnings of a game once in Action! Only got as far as walking around a
simple 3d dungeon. It was step movement like Ultima III or Dungeon
Master on the ST and I did get a few compliments on it looking better
then UIII, but that wasn't exactly a great looking game anyway. I had
done a term program interpreter that accepted commands from a bbs. I
figured the combination of the two could make for an MMPOG but stopped
programming on my Atari when I got too much grief from my S.O.

I mean you couldn't do something like WoW but you could get a simple 3d
multiplayer rogue clone going over the internet. Not that anyone would
play but it could be done on an Atari with screen flipping to match the
speed of just about any game out there now.

Okay, so I'm stupid and don't know much about PC hardware. :^)

I got my MyIDE cartridge a few weeks ago, dug up a 2GB HD I had sitting
in the 'get rid of' pile, and decided to keep it, and finally tonight
bought an external USB drive enclosure (for the power) and an IDE cable.

So, the IDE cable has one blocked pin hole, near the middle. Since there
are exactly 40 pins on the MyIDE cart, and only 39 on the IDE cable,
I can't plug the damned thing in!

Should I break the pin in question off of my MyIDE cart!? Should I try
and drill a hole in the IDE cable? Should I just get a different IDE cable?
(I had no idea there'd be an issue! <:^( )

Thanks

There's rarely those pins blocked out on IDE cables bought here in Norway,
but I think you should just get another cable. Probably have an old junk PC
lying around, right?

I've seen these cables, mostly in PC's from Compaq (ouch, that hurts just to
type) and similiar ones. Good luck!

Yes, I know :-)

ATM I'm trying to finish the new release of AtariSIO and also put
quite a lot of time into the AtariSIO bootdisk. A Debian package
is scheduled as soon as everything runs fine :)

so long,

Hias

I take a very sharp tipped knife, press the tip into the plug,
and twist gently. They aren't usually embedded so deeply that
it won't be gone in a few twists of the knife. Also a very small
drill will remove it, but be very careful. It could walk and ruin
the plug completely. Good Luck.

P.S., if you are not too picky, I can send you a used IDE cable
or 2 to try out.

Method 1:
Take a thumbtack and push a hole in it.

Method 2:
Bend back the pin on the IDE cartridge.

No big deal.

Thomas

I went the drill route, and things seem to work. At least, I have
drive 1 and drive 2 partitions on my little 2GB HDD! :^) Awesome!

Unfortunately, though, when I run SCANDISK.BAS off the 'UTIL32F.ATR' disk,
after a few moments I get this:

```
  ...
  Starting MyIDE-DETECT(tm)
  Sectors   : 63
  Heads     : 0

  ERROR-   3 AT LINE 520
```

:^(

This is an old Quantum Fireball ST 3.5 Series drive that I shoved in the
cheapest USB external casing I could find at Fry's ($40 USD) and connected
with the aforementioned IDE cable (bought new, it's twisted so it's round
in the middle, rather than a big flat cable)... after drilling a hole where
that extra pin wanted to go. :^)

FDISK.BAS couldn't auto-detect the drive's geometry, so I looked it up on
the web: 63 sectors, 16 heads, 4092 cylinders.

So, maybe this is a bad/dying drive? Or incompatible? Beyond this

Atari BASIC error that SCANDISK.BAS is giving me, is there a way I can tell?
;^)

PS - When's someone going to write a Linux kernel driver for reading/writing
Atari 8-bit/MyIDE formatted hard drives!? >:^) Bwahahahahahah!

Heh, well, I bought it new at Fry's Electronics for about $3 USD.
It has the advantage that it's not all ribbon-shaped, so it can bend and
twist much more easily.

> Probably have an old junk PC
> lying around, right?

Nope. :^)

> I've seen these cables, mostly in PC's from Compaq (ouch, that hurts just to

Thinking back to the few times I've messed with HDDs and CD/DVD drives in
my Linux boxes, the blocked pinhole seems pretty familiar, actually. :^/

It was brand new, from Fry's! Oh wait... Fry's kinda suck. ;^)

(They didn't have a CompactFlash <-> IDE adapter, which would've been the
coolest to use. I have a 16MB CF card sitting around not doing anything.)

Awesome! Is it going to be part of Debian proper? Or are you or someone
else simply going to release a .deb file that people download or point apt at?

(The former would be the best, of course, since you'd have the benefit of
living in Debian itself.)

Has anyone tried AtariSIO on any other Linux platforms? (Other than x86?)
It'd be awesome to get a serial cable for the Sharp Zaurus and run AtariSIO
on it. (It's a 2.4 Kernel running on the ARM platform.)

Gentlepersons,

Many years ago I was a devoted Atari user and I accumulated a large amount of Atari hardware. Over the years, my interest waned and all of my stuff got packed in boxes. I'm getting ready to move and have decided that there is no need to move the Atari boxes again.

I don't have a list of exactly what's in the boxes, but I know that there are a couple of 800's a couple of 800XL's, a 400 with a 48K mod, a couple 810's, one with a happy drive mod, an Indus drive, a 410, a printer, a color monitor and a ton of software. A lot of the software is utility and system software, but there are the usual number of games. I also have a number of magazines, mostly Antic and Analog, and books. There may be a copy of De Re Atari, but I can't remember. None of these items have been used for probably 12-15 years.

Anyway, I don't have the time or inclination to pack everything up for shipment. I live in Elkhart IN. If anyone is close enough to come pick it up, it's theirs. If no one expresses an interest with a week or so, I'm going to take it all to the local thrift store for donation. Please respond to fulkersonj@hotmail.com if you have any interest. If more than one person is interested, first come first served.

A last note, I don't have time to sort through the boxes for specific items. It someone is interested, It's take all or nothing. Hey, I'm giving it away for free, I can afford to be stubborn.

Thanks for your time.

Jerry

At first I'll just create an apt repository on my webpage. Maybe later
I'll try to get AtariSIO integrated into Debian.

so long,

Hias

That's not a bad way to configure it, if you
have the correct numbers.

> So, maybe this is a bad/dying drive? Or incompatible? Beyond this
> Atari BASIC error that SCANDISK.BAS is giving me, is there a way I can

You might want to hook it to an old PC first
and low-level format it, then try it on the
Atari. Can the interface on the Atari detect
marked bad sectors? If not, and it has them,
it may attempt to use all of the drive. This
will give you problems.

All the CF to IDE you can imagine, right here.

My program doesn't and I don't think Sijmen's does either. Bad sectors, especially in the "important" places of the drive, will really screw things up.

Sector 1, Head 0, Cyl 0 is where the configuration information goes.

In my programs for MyIDE:
Sector 2, Head 0, Cyl 0 is where I am storing partition descriptions.
Also, the last couple of image slots is where I am storing the image manager configuration and image descriptions.

I have new utilities to support the 3.5F version of the MyIDE software, but they haven't been posted on-line yet. The versions that are up on my page are for the old 3.1 version of the software.

Hi
I read some of the interesting books at http://www.atariarchives.org/
I would like to run the BAS files directly in Atari800win+
Is there a utility that easily converts BAS files to ATR files?
/Aces123

Many emulators allow direct access to .bas/.com./exe files...

Failing that, Ken Siders has a great Win utility to manage ATR
images including an Insert Binary option; go to:
http://atari.ksiders.tzo.com/a8emulators.html

Jess

An easy way to quickly run simple BASIC program is to use
the emulators cassette functions.

Boot into BASIC, with or without DOS
Choose 'Tape recorder...' on the Atari menu
click browse.. default shows only CAS files, so show all files
select any tokenized BASIC file
at the READY prompt type CLOAD<ENTER>
at the Braaaap! press <ENTER> again
LIST or RUN or whatever

METHOD 1

Put BAS files in any folder on your hard disk

Setup Atari800Win Plus hard disk emulation (ALT+H). Point H1:-H4: to above folder.

Boot any DOS bootable ATR straight into BASIC.

You can load your BASIC programs from directly the virtual hard drive (e.g. LOAD "H1:MYPROG.BAS").

Alternatively you can copy the BAS files from the virtual hard drive to any DOS formatted ATR/disk.

If you want to grab a BASIC program directly from a webpage, select it, copy it, and save it to a folder.

Just as above setup a virtual hard drive. However when you actually load the program choose H6:-H9: which are the same virtual drives as H1:-H4: but when you access the former then Atari800Win Plus automatically does ASCII Line Feed/ATASCII EOL conversions.

Since captured programs aren't tokenized BASIC you need to use the ENTER command (e.g. ENTER "H6:WEBPROG.TXT"). You can then save the program back to H1:-H4: (e.g SAVE "H1:NEWNAME.BAS") or to any DOS formatted ATR/disk (e.g SAVE "D2:NEWNAME.BAS")

METHOD 2

Use an ATR builder program like MAKEATR to install all your BASIC programs into the ATR. Select any format. Boot the matching DOS ATR (MyDOS, SpartDOS, or Atari DOS). Load your programs from BASIC.

METHOD 3

Build an ATR just as in Method 2 but choose Atari DOS or MyDOS format only (not SpartaDOS). Install Matthias Reichl's excellent MyPicoDOS onto the ATR. Now you have a bootable, menu driven ATR/disk that will automatically startup BASIC when you select a BASIC program.

One caveat, BASIC programs that require DOS won't work very well since MyPicoDOS is a game DOS not a full fledged DOS.

MyPicoDOS can also load COM and EXE files automatically disabling BASIC. You can mix different types of programs on the same ATR/disk.

 Now I get "FATAL: Error inserting atarisio
(/lib/modules/2.6.11-6mdk/misc/atarisio.ko): Invalid module format".

Yay.

Ouch. That's not good. Either a build problem or (again) some weirdness
with Mandrake Linux.

Try to start from scratch again, unpack the tarball into a different
directory and uncomment the "USE_KBUILD_26 = 1" line in the Makefile.
Leave all other settings at their default.

Now do a "make dep" and then "make". The beginning of the output
of make should look like this:
make
make -C driver
make[1]: Entering directory `/home/hias/atarisio-0.30-pre2/driver'
using kernel 2.6 build system
make -C /lib/modules/2.6.12/build
SUBDIRS=/home/hias/atarisio-0.30-pre2/driver modules
make[2]: Entering directory `/work/src/linux/linux-2.6.12'

```
  CC [M]  /home/hias/atarisio-0.30-pre2/driver/atarisio.o
  Building modules, stage 2.
  MODPOST
  CC      /home/hias/atarisio-0.30-pre2/driver/atarisio.mod.o
  LD [M]  /home/hias/atarisio-0.30-pre2/driver/atarisio.ko
make[2]: Leaving directory `/work/src/linux/linux-2.6.12'
make[1]: Leaving directory `/home/hias/atarisio-0.30-pre2/driver'

If you get any warnings or if your output differs, please post your
output.

Then, do a "make install". Again, the beginning should look like this:
# make install
make -C driver install
make[1]: Entering directory `/home/hias/atarisio-0.30-pre2/driver'
if test ! -d /lib/modules/2.6.12/misc ; then \
        mkdir -p /lib/modules/2.6.12/misc ; \
fi
install -o root -g root -m 644 atarisio.ko /lib/modules/2.6.12/misc
depmod -a

Now try again "modprobe -v atarisio".
If this still fails, it's time for another check. Enter "make clean"
and then "make V=1". The latter will cause the kernel build system
to be more verbose. On my Debian Sarge box it looks like this
(long lines are wrapped):

# make V=1
make -C driver
make[1]: Entering directory `/home/hias/atarisio-0.30-pre2/driver'
using kernel 2.6 build system
make -C /lib/modules/2.6.12/build
SUBDIRS=/home/hias/atarisio-0.30-pre2/driver modules
make[2]: Entering directory `/work/src/linux/linux-2.6.12'
mkdir -p /home/hias/atarisio-0.30-pre2/driver/.tmp_versions
make -f scripts/Makefile.build obj=/home/hias/atarisio-0.30-pre2/driver
  gcc -Wp,-MD,/home/hias/atarisio-0.30-pre2/driver/.atarisio.o.d
    -nostdinc -isystem /usr/lib/gcc-lib/i486-linux/3.3.5/include

http://www.crowcastle.net/preston/atari/

I've put out a new revision of the SIO2Linux (formerly femul) program.
```

This is a simple Linux program for use with a SIO2PC cable. Features
include:

* No kernel modules. It's just one .c file to compile.
* Creates dynamically-sized disk images--they grow to the last sector
  written.
* Mount your local file system as a disk--files are mapped to sectors in
  a virtual image as you read them.

Enjoy.

Unfortunately, my 800 died on Saturday, and my 800XL needs a power supply,
so I won't be able to test any new developments until I get something up
and running again. (I'm in the Boston area if you have extra equipment to
donate.)

http://www.crowcastle.net/preston/atari/

Back in the mid 80's, I wrote a sector editor in BASIC. Over several
years, I incorporated additional features and tools, as well as re-wrote

various routines in assembly language for speed. I should have released it
back then, but now I've gone back through it and added a few extra
features. I also re-worked all of the assembly language code.

Features include

    * Sector editor
    * Show the sector chain for a file
    * Disk copying
    * Single and Enhanced density support
      Sorry, no double-density support
    * Tachometer
    * Generate the world's smallest Autorun.SYS files

Enjoy!

Good Job Pavel !

Good luck in development !

I tried it, but sadly, it didn't seem to work. (The Atari acted as
though there's no disk drive attached.)

My setup works fine with AtariSIO.

I'm running Debian etch on an AMD Sempron 2200 with an Atarimax SIO adapter.

The no-need-for-kernel-module concept sounds nice. AtariSIO's atariserver
interface is great, though. I wonder if parts of these projects could be
combined? :)

Thx!

The other evening I started playing with my shiny new MyIDE cartridge,
and old spare 2GB HDD I had lying around, and the IDE cable and
USB external HDD enclosure I bought from Fry's Electronics:

  http://www.newbreedsoftware.com/bill/news/images/atari-myide.jpg

Last night I tweaked with the enclosure's case a little to get it to fit
as best it can (there's no wiggling room for the HDD, and it's supposed
to _just_ fit, connecting to the IDE pins inside, so it's actually in there
at a slight engle). I also broke the fan holes in the back to let the IDE
cable sneak through more easily:

  http://www.newbreedsoftware.com/bill/news/images/atari-myide-final.jpg

Still a little crappy looking, but about as professional as I'll get it. ;)

Looks great to me, Bill, and I'm a hardware guy. :o)

When I'm ready to do such a thing though, I'll more
than likely go with a CF to IDE adapter and have it
all one piece, pluggable whenever I desire to use it,
as are some of the newer devices for our Apple IIs.

Wow, pretty slick looking!

I wanted to go the IDE->CF route, but as I mentioned earlier, Fry's sucks. ;)

Maybe one day. In the meantime, the HDD route seems pretty slick on its own!

I'll probably show this off at the Vintage Computer Festival (VCF) in
the SF Bay Area later this year.

Well... here we go... The only thing edited in the makefile was the
"USE_KBUILD_26 = 1".

Here is the output from "make dep".

```
[root@localhost atarisio-0.30-pre2]# make dep
make -C driver dep
make[1]: Entering directory
`/home/david/.local/share/Trash/files/atarisio-0_1.30-pre2/driver'
make[1]: Nothing to be done for `dep'.
make[1]: Leaving directory
`/home/david/.local/share/Trash/files/atarisio-0_1.30-pre2/driver'
make -C tools dep
make[1]: Entering directory
`/home/david/.local/share/Trash/files/atarisio-0_1.30-pre2/tools'
rm -f .depend
for i in *.cpp ; do \
         g++ -I/lib/modules/2.6.11-6mdk/includes -MM $i >> .depend ; \
done

Yeah. The first link is my store. The drive in the pic is
made by a guy in Germany and we only retail them. The one
in the second link is made by a guy in the US and he handles
his own distribution.

> I wanted to go the IDE->CF route, but as I mentioned earlier, Fry's sucks.

Fry's is ok, but they don't carry everything you might want or need.
I had posted a link to where I get my adapters earlier, and if you
missed it, I can send you the link in email.

> Maybe one day. In the meantime, the HDD route seems pretty slick on its
> own!

Yes, I agree, it's neat looking. Good Job.

That'll be great. Did you ever get to meet the Apple One Replica
designer there? That's a very impressive machine. His rivals the
original in everything but price. :o)

Yeah, I saw it. T'was too late by then, though, but I've bookmarked it,
thanks. :^) I've got a pair of Atari Flashback 2's to buy first...

This is strange. It should actually be "/lib/modules/2.6.11-6mdk/build".

What's the output of "uname -r" on your computer?

Could you edit the Makefile and set "KDIR" by hand to the location
of the kernel source code, then try "make" again.

I've never actually seen one but it sounds like an RVerter cable, for
connecting a modem directly to your 8bit.

another plea for help here, one of my old 800's has just lost keyboard
function. The break key still works, and the space bar sometimes gives an M
on screen, nothing else. I have tried swapping various parts between the
machines, and it is not the keyboard, rom or ram. Any idea where to look
next ?

thanks

If the keyboard is okay, I would try looking at the 4051 multiplexers
between the keyboard and the POKEY chip. These help scan the 8 x 8 matrix.

Space and M are on the same row

K5,K4,K3 = 1,0,0

but on two different columns

K2,K1,K0 = 0,0,1 for space
K2,K1,K0 = 1,0,1 for M

so that suggests the K2 connection is faulty at least.

These keys are sensed by input KR1.

Control, shift and break are read by input KR2, and this goes directly from

the keyboard to another pin of the POKEY chip. That suggests POKEY is
reasonably alive and well.

Can you at least tell us what is happening on pins 9, 10, 11 of the 4051
chips?
They should be toggling rapidly.
Check pin 16 is a healthy 5V.

Hi,
This could also be a SIO2PC interface with the older style 25 pin connector

and electronics built into hood. Also could be and Xformer cable. Other multiple possibilities. Check under the HOOD and tell us what is there. (i.e.) resistors, 14 pin chip with numbers on it, diodes, etc...

    I saw a friend take a 65XE and over years watch that poor thing just fall apart. It was really funny to see happen. How the keyboard fell apart to the point my friend had to jump points on the keyboard to short the right key to start his games.
    Star Raiders was a real pain to play at that point. :D

    Sadly, my opinion of the 130, 65 and XEGS wer formed from those experiences.

    Doc Clu... who prefers an Atari 800, and recently warmed up to the 800 xl.

    (only took me nearly 20 years to warm up the xl.. but hey!)

On Wed, 24 Aug 2005 at 09:53 -0400, Mike Morgan scribbled:
->One of the cables is a mystery to me. It's an SIO->DB25(male).
->Does anyone know what this cable is used for?

Since P:R:s tend to be sensitive, I don't want to move or even touch mine unless I have to. So I'm relying on the manual for a reminder of the technical details. It says that the two serial ports are nine pins while the parallel port is 15 pins. If your mystery cable has a true Atari SIO end on it then that would be 13 pins. In that case it isn't a regular daisy-chain cable and it isn't a P:R: cable. It sounds like an extra cable that somebody got hold of which should be treated as a separate item.

It could be called a crazy cable. That's what dealers at ham-fests and computer shows call them. Despite the name, it's a ser-ious and potentially useful item. If somebody has a need for a 13-to-25 cable, *and the pins are connected the way they're needed* for that particular situation, then this cable would avoid having to build one. (Been-there-done-that! But it's a lot easier to buy one -- if you can!)

This cable could also connect between the Atari 8-bit and some 25-pin device. But it would end the daisy chain unless other Atari SIO ports were available. If you really want to identify an Atari application for it, perhaps it's mentioned in the FAQ file, or per-haps people at Best Electronics or B&C could identify it.

I forgot my real camera, so had to settle for a cameraphone's camera. :^P
But, here they are:

  http://www.newbreedsoftware.com/bill/photos/cgexpo-2005/

Also, a coupla weekends prior I went to California Extreme (also in Calif).
I forget if I had mentioned those photos around here already, so here ya go:

  http://www.newbreedsoftware.com/bill/photos/calif-extreme-2005/

Enjoy! :^)

RoyE,

    The only electronics is a resistor between 2 pins on the DB25 side.
I didn't count to see what pins but I imagine it's probably Vcc or
ground to terminal ready pin. The only other thing of note is that it
looks like a quality job (no globs of solder, wires all perfectly cut,
etc.), suggesting that it may have been produced in bulk. Tonight I may
take it apart again and do a pin->pin map.

thanks,
Mike

Mike
This cable is most probably the Xformer cable. Check the following link.

http://www.emulators.com/xformer.htm#CABLE

If it looks like this then the mystery is solved.

Not likely to be a SIO2PC cable which uses female DB-9/DB-25 connectors
to mate with the PC serial port which is always has a male connector.

The cable in question has a male DB-25 connector.

Sorry, for the late response.

Based on an Email I received from Hias along with his latest bootdisk
update I assume you have already been helped.

You will enjoy AtariSIO very much. It's so easy to use!

The easy one first. I've been given and 800XL. It seems to be near new condition but the left shift key binds. Seems like it needs lubricating but before I try to pop the key I want to make sure this isn't a No-No. Suggestions?

Compared to my now 26 yr-old 800 the 800XL had terrible video quality so I started looking at Ben Poehland's Super Video XL 2.0/2.1/2.1a mod (see link at end). First thing I did was clip capacitor C56. Right there the bluriness was gone. Since the only video cable I had on hand was the DIN-5 to SVideo cable that I use for my 800 I was only getting a Black and White picture. This is because the 800XL doesn't normally have Composite Chrominance available. So that was the next thing I planned to change. Now mod 2.0 suggests installing a Composite Video enable/disable switch. This cleans up graininess and vertical lines when SVideo/chroma+luma is used. Since I don't ever plan on using Composite Video I just clipped resistor R56 instead of putting the SPST switch in series. To save myself a trip to Radio Shack I reused the resistor as the "pick-off" resistor for chroma connection. Now here some questions regarding this video mod.

The instructions call for a 100 Ohm resistor for the pick-off resistor but the one I re-used is 75 Ohm. How much difference will this make? What is a "pick-off" resistor anyway?

The video looks darn good now. The blurriness is gone. Text is incredibly sharp. Contrast and color saturation are at least 25% better than my 800 (which produces washed out colors, IMO). Not much

noise (RF?) with either machine but the 800XL is ever so slightly worse than the 800.

I do have one problem. At high contrast transitions there is an artifact that resembles ghosting or shadowing. On text it shows up as a shadow or even a different color on the leading edge of each text character. It's actually not very noticable on text but stick out like sore thumb at the left margin of the BASIC screen, where the blue Window is next to the black border. The shadow is green or grey. (I'll try to provide a picture in a followup message).

Here the question(s). Could this problem have anything to do with my using a 75 ohm pick-off resistor instead of 100 ohms? If not, would it be corrected if I complete the rest of the 2.0/2.1 mod or at least more of the mod? Could my poorly assembled video cable (made by me LOL) be the cause, though the issue does not show up on my 800 using the same cable.

Now to change the subject (with more questions). Short of buying an EPROM programmer (which I have no intention of doing) what are the options for DIY OS ROM mods?

Has anyone actually installed the Dallas SmartSocket plus SDRAM? What success, problems, issues?

Is it possible to use EEPROMs in place of EPROMs? If so which type/size? Come to think of it, what size/type EPROM is used for the 800XL?

What OS's are a good choice for the 800XL to play with. Is licensing an issue? Keep in mind this is exclusively for my own machine and for my own use. I just want to experiment.

Stephen Sheppard

Thanks to Ron Hamilton you can find a version of T:Edit on my site at
www.mathyvannisselroy.nl (on the special stuff page) which will show you
the directories of drives 1 through 9. Not just the lower four plus D8:.

BTW T:Edit has an anoying bug. I mention that on the same page IIRC.

Try it and see.

Easy way to do this is to hold a 300R resistor in parallel with the 100R.

> I do have one problem. At high contrast transitions there is an
> artefact that resembles ghosting or shadowing.

Sounds like the signal is 'echoing' in the cable.

The point of having 75R output impedance is that it ensures maximum signal transfer from source to cable, and from cable to input. At the input end it minimises reflected energy.

> Could this problem have anything to do with my
> using a 75 ohm pick-off resistor instead of 100 ohms?

Sounds probable.

A bigger power rail decoupler may help. See:
http://www.howell1964.freeserve.co.uk/Atari/800XL/Atari_800XL_Video.htm

> Is it possible to use EEPROMs in place of EPROMs? If so which

> what size/type EPROM is used for the 800XL?

16K for the OS and 8K for the BASIC.

Perhaps you could frig them both into a 32K EEPROM.

Of course you will have to do some work yourself, checking pinouts and wiring in a write signal if you plan to have it reprogrammable in-site.

K.

I recently purchased a 65xe and much to my suprise it has the same
expansion port in the back as the 130xe. Everything I've read states
the 65xe does not include this port (at least not the NTSC model) so
does anyone know what I have? Im thinking maybe some of the early
ones or later ones in NA did include the port?

Kevin

The resistor I used IS 75 Ohm. It's the modification instructions that
call for a 100 Ohm resistor.

I meant I wanted clarification/verification on what type of
EPROMS/EEPROMS will/might actually work.

2716's? 2818B's?

> Of course you will have to do some work yourself, checking pinouts and

Designing circuits are probably beyond my ability and understanding.

I might find the resources on hand to be able to write EEPROMs using
other hardware, possibly. Of course, I would like to learn whether
EEPROMs will work or not, as-is, in the place of the Atari OS ROMs.

I'm seriously thinking about the Dallas SmartSocket but I sure would
like to talk to someone who has already tried that mod.

Thanks,

Stephen Sheppard.

I sort of agree of you... altho I had a 130xe for over 10 years and
didnt have any problems, I prefered the keyboard on my friend's 800.
I've really been looking for a 1200xl which I think is the coolest
looking Atari and is supposed to have the best overall keyboard, but I
couldnt find one in good condition for a reasonable price. This 65xe
is in great condition and it seems to work well... even including the
130xe's expansion port (?!?) so I can't complain.

FYI - the ability to disassembly ROM files is in the latest CVS, so it'll
be in 1.7 (should be soon too).

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

Model 800XE and later one of 65XE have got this expansion port. First
models has only the short version.

thanks I did look back into the newsgroup archiives and found that the
later model North American 65xe's did feature a 130xe motherboard with
less memory. This is not listed in the official faq, whoever writes
it should update it, the 65xe's with the ECI port started being sold
in the US in 1987 according to an official Atari addendum to the 65xe
manual (which I was able to find doing a Google search at a very
interesing website.. whose name escapes me now...).

Now I am faced with this delemna, my 65xe is in great condition and
still has the warranty sticker intact, should I open it up and add the
extra 64k to make it a 130xe (asssuming this is an easy mod, which I
will not know until I open it up) or should I just leave well enough
alone and be happy I have a almost mint condition and rare version of
the 65xe...

Hi,

> > 16K for the OS and 8K for the BASIC.
> >
> > Perhaps you could frig them both into a 32K EEPROM.
> >

> I meant I wanted clarification/verification on what type of
> EPROMS/EEPROMS will/might actually work.

> 2716's? 2818B's?

The Basic ROM seems to be non-standard to me, I haven't been able
to find a fitting EPROM. Instead, I used an adapter. Otherwise, you
would need a 2764 or larger here. The Os-ROM is in a standard ROM
chip that is pin-compatible to a 27128. I have already replaced the
basic ROM on my system, haven't tried this with the Os ROM yet, but
the pinout is identical and I see no reason why this might fail.

I have no experience concerning EEPROMs, if you have success, I
would be curious to hear.

So long,
     Thomas

I've just tried to install the 256K memory upgrade obtained from
Atarimax. Although the document is great, it references a part (U27)
which doesn't exist on my MB. I serached the internet for schematix of
the 800XL, and I found the U27 in all of them. What kind of revision I
have? It is labelled as 800XLF R-3. Can anybody give me a schematic of
this?

Thanks,
Jozsi

I'm using an AMD 29F010 (128k) flash ROM in my main 800XL. I've built a small adapter socket and connected 3 pins to switches so I can easily switch between max. 8 OSes (actually I use 2 switches, one SPDT and one DPDT with a neutral position plus two pullup resistors so I can choose between 6 OSes - this way I "loose" 32k but it's easier to select and I don't need 3 switches in my Atari).

Instead of the AMD 29F010 you can also use a Winbond 29EE011 or an SST 29EE010 (these chips were often used on PC mainboards as BIOS chips, so if you have a dead PC have a look if you can salvage the BIOS chip). I've tested all three chips and they work equally well.

But: don't use a ST 29F010, it won't work well! Using it for an XL OS worked fine, but using it for the "old" (Atari 800) OS failed. I don't know what exactly is going wrong, maybe some access patterns put the chip into ID mode or something like that.

Programming the flash ROM from within the Atari is not so easy. You would need some additional hardware to select the higher address lines, connect the /WE line, write a flasher program and completely turn off all interrupts and DMA while re-programming the OS.

I programmed the flash using the new upcoming Turbo Freezer, but you can (of course) also use an EPROM programmer (just check out if these chips are actually supported, my old programmer didn't handle the AMD flash although it should have been supported).

BTW: programming these flash chips is not too complicated, the algorithms are documented in the datasheets and all three chips are quite similar. My code also supports the AMD 29F040, a 512k flash ROM, which will be the default flash chip on the Turbo Freezer. So if you'd like to have 32 OSes in your Atari that's also possible :-)

so long,

Hias

Hmm, I don't see why 100R was specified.
I would have thought 75R was more appropriate, to match the cable and TV
impedance.
I'd stick with 75R, unless anyone has a good reason for choosing 100R.

> I meant I wanted clarification/verification on what type of

>
> 2716's? 2818B's?

The Atari machines used mask-programmed ROM chips (type 2364, 23128) because
they are cheaper in serious numbers. And they don't fade (AFAIK). They have
pinouts like this:

http://www.howell1964.freeserve.co.uk/parts/MPROM.htm

while EPROMs have pinouts like this:
http://www.howell1964.freeserve.co.uk/Arcom/J037_SEP.htm#EPROM%20pinouts

and EEPROMs / Flash ROMs have pinouts as per their datasheets.

They have many pins in common, but there are always a few differences.
The links above highlight the differences inside each group, you can work
out the differences between the groups.

The 23128 and 27128 are similar in pinout and have the same 28-pin package.

The 2364 has 24 pins and the 2764 has 28-pins, so that's harder to replace.

> Designing circuits are probably beyond my ability and understanding.

You'll have to get someone else to design the mods if you cannot find them
on the web.

> I would like to learn whether
> EEPROMs will work or not, as-is,
> in the place of the Atari OS ROMs.

You probably won't be able to pop them in there and go.
The Atari does not provide a !WR signal so you cannot write to them in situ.

Cool. Can we see your adapter circuit anywhere?

Thanks for the tip. The Atari should not be trying to write to ROM
locations, so perhaps it has a bug that is harmless to ordinary ROM.

->sticker intact, should I open it up and add the extra 64k to make
->it a 130xe (asssuming this is an easy mod ...) or should I just
->leave well enough alone ...

Does this 65XE connect to a monitor? (North American 65XEs connected only to televisions.) If not, then you'd have to add that too. Without monitor capability it's still a 65XE, regardless of how much it's souped up.

BTW, I wouldn't label the warranty as this 65XE's strongest selling point. <grin>

I wouldn't call it a circuit :-)

Actually, it's just a stack of 3 IC sockets: One 28-pin socket (to
fit into the Atari OS ROM socket), a 28-pin socket with a few pins
cut out and a 32 pin socket for the flash ROM.

The fine thing is that the 16k ROM and the 128k flash ROM have almost
identical pinouts - the flash just has 4 more pins.

The following pins are cut out on the 28 pin socket: 1, 27, 28.
Pins 2-26 connect directly to pins 4-28 of the flash ROM.
Pin 28 (VCC) is connected to pins 32 (VCC) and 31 (/WE) of the flash,
pins 2 (A16), 3 (A15) and 29 (A14) of the flash are connected to the
switches. Pins 1 and 30 of the flash are NC. That's it :-)

so long,

Hias

Actually all 65xe's have a monitor port, including mine, you are thinking of the 600xl. My 65xe is a later model which uses the 130xe motherboard. The only difference between this machine and a 130xe (even the mb says 130xe) is a resistor and 2 less memory chips. The earlier North American 65xe's used a custom motherboard that was missing the ECI port and could not easily be upgraded to 128k.

It is in such good condition and it has the sticker intact, I like to collect Atari stuff as well as use it, so to me it has value being in such prestine untouched condition, but you right I dont the modern Atari is going to fix it if anything goes wrong!

Have you ever tried Uniflash for the PC?

On a working PC you hot swap the BIOS ROM then you use Uniflash to flash whatever code you want to the chip. Well, that's theory, anyway. I once tried it to recover from a failed flash but motherboard differences and my unfamiliarity with Uniflash and flash ROMs led to failure.

Thanks for sharing! This is exactly the kind of stuff I want to read

about.

   On Fri, 26 Aug 2005 at 09:55 -0400, kevin scribbled:
->Actually all 65xe's have a monitor port, including mine, you are
->thinking of the 600xl.

   Ouch! You're right; I was thinking of the wrong model. Sorry
about that!

->I like to collect Atari stuff as well as use it, so to me it has
->value being in such prestine untouched condition,

   Many collectors, in and out of computers, would agree. That's
one reason why you might leave it as is until it's really necessary
to upgrade it.

Actually, the idea of using a flash ROM in the Turbo Freezer came
from Guus Assmann. Torsten Schall then told me about the PC BIOS
chips (he salvaged a lot of them and sent me some for doing tests).

After I finished the flasher program for the Turbo Freezer I had
the idea that I could also use these chips in the Atari :-)

BTW: The 29F010 is organized in 8 banks of 16k that can be erased
and programmed separately. Suits the size of the Atari OS quite well :-)

The SST/Winbond chips are organized in 128 byte pages. Theoretically
one could build a flash disk for the Atari using these chips
(that would be a 1024 sector SD disk). But be careful: the Winbond

chips are only specified for 1k (or 10k, depending on the type)
program/erase cycles. The SST chip should survive 100k cycles.

The programming algorithm of the SST/Winbond chips differs slightly
from the AMD algorithm and is a little bit more timing critical:
if the bytes aren't written fast enough the chip leaves programming
mode and returns back to read mode. When disabling interrupt and
DMA on the Atari, this is no problem.

> Have you ever tried Uniflash for the PC?

No, not yet.

> On a working PC you hot swap the BIOS ROM then you use Uniflash to
> flash whatever code you want to the chip. Well, that's theory, anyway.
> I once tried it to recover from a failed flash but motherboard
> differences and my unfamiliarity with Uniflash and flash ROMs led to
> failure.

I heard of this method some time ago but I have to say that I'm not
too comfortable plugging chips in/out while the PC is running. I did
this a few times with the Turbo Freezer (while the ROM wasn't
accessed, of course) and it often led to crashes (actually, that's
what I expected).

so long,

Hias

I suppose if one had a supply Flash ROMS a 1K write cycle would not be
a huge problem.

I found I only have one old mobo with a 29F010. I'd need more if I
wanted to attempt the Uniflash method for re-writing.

Though I failed with Uniflash I have hot swapped BIOS ROMs about half a dozen times. Once with a DIP-32 and 4-5 times with a PLCC chip. Swapping the DIP was easy. I made a loop of tape to make a handle to wrap lenghtwise around the Flash ROM. Just set the ROM in the socket without fully seating it, boot the computer, hot swap the chip, and flash using the normal method. It was a lot trickier (and riskier) with a PLCC chip. There is not an easy way to make a handle and the chips don't work unless you seat them. I put a piece of tape on the top of the chip but need the PLCC extractor to actually remove the chip. I dropped the chip into the motherboard the first time but no harm.

I understand most of your description of your Flash ROM "adapter" but is there any chance you could post a wiring list or schematic and a parts list. Mostly which model DIP Sockets did you use? Are they all stackable?

I think I first would like to build the SmartOS upgrade (see link) because it can be reprogrammed from the Atari and it provides 512 bytes of non-volatile memory which would have so many uses.

It might be more of a problem than you would at first think. The directory
sectors and sector map gets written to quite often with even trivial disk
use.

Did you know Hasbro has put PDF scans of manuals for Parker Brothers software
for Atari computers on their web site? I found:

AstroChase
Chess
Frogger
Frogger II: Threeedeep!
Gyruss
James Bond 007
Popeye

Q*Bert
Star Wars Return of the Jedi: Death Star Battle
Super Cobra

Check it out:

One of us is confused.

I meant the 1K writes limitation shouldn't be an issue when using Flash
ROMs as OS ROMs. It's true one might want to try several
configurations before one gets it right but 1000 attempts is more than
enough I should think.

Hi,
I was going through my 8bit stuff after packing it away 10 years ago and
found my Express BBS Pro Disks, but when I try to boot any of them they say
"No Dos".
Which Dos does it need? Dos XE/XL? SpartaDos or what?

I bought the APE interface and was thinking of setting my old BBS back up
using Express Pro through telenet.
Can someone tell me how to boot this up?

Thanks,
Jay

Micheal I include a link that proves my 65xe is North American and has
the ECI port, because I cant find the site now either. I have talked
to several people on Atariage.com that back it up as well. It seems
to cut costs during the end of the XE lines lifetime they made one
motherboard and the only difference between this 65xe and the 130xe is
one resistor and less ram, it can be relatively easily upgraded to
128k. Also some of these models are known to have faulty GTIA chips.
here is a link to the picture I took of the bottom of my 65xe:

http://members.cox.net/kev77/65xeECI.JPG

Notice the FCC label and the eci port. You can also see the warranty
sticker is still intact but if I did take it apart the motherboard
would read 130xe not 65xe. This is useful info as I was completely
shocked when every faq states emphatically "the NA 65xe does not
feature a ECI port" when infact some do.

Also here is link describing how to modify such a machine to 128k:

Oh! I thought you meant using it as a ramdisk, like was mentioned. My
mistake!

That's Ok I'd been excited about two different upgrades and talking
about them both.

I was impressed by the simplicity of Hias' triple stacked sockets but I
also liked the SmartOS upgrade which uses static RAM and has the
benefit of being writeable like ordinary RAM or protected ROM. It's
the former feature of the SmartOS upgrade that I mentioned briefly
earlier.

Lots of enhancements for this one - download at:

http://sourceforge.net/project/showfiles.php?group_id=145747

Version 1.7

Thanks to Steven J. Tucker for giving us many ideas.

New features:
- The dump popup menu has an option to guess byte type. This option
  tries to follow the flow of the program beginning with the byte
  selected by the user. All data in the flow of the program is
  marked as code.
- There are two other options in the dump popup menu to select next
  block of unknown type and to change the remaining data to bytes.
- An option has been added to display Zero-Page instructions with
  absolute addressing mode as bytes. These instructions use 3 bytes
  instead of 2.
- The disassembly now centers the selected line and displays it with
  a yellow background.
- Disassembly window has a popup menu which offers options like find,
  find next, select definition of a label, select all references of
  a label and rename a code label (Lxxxx).
- Double click on a line in the disassembly window jumps to the
  definition of the label found in the instruction.
- The disassembly popup menu has an option to return to the previous
  position after a jump to a definition or to a reference.
- Mouse wheel is now supported and scrolls the window under the mouse
  cursor.
- The File menu now supports ROM file loading and raw file loading.
  Only ROM with no bankswitching are loaded.
- 2 sub-menus have been added in the File menu to open recent files
  and recent workspaces.

- User labels can be exported in xasm format to be loaded in
  Atari800Win emulator.
- System labels can now be unloaded from the Label menu.

Fixed bugs:
- Opcode $B6 produced a bad disassembly.
- When $00 address was referenced, an L0000 was used but not defined
  in the disassmebly listing. This label is not used anymore.
- 5200 files are loaded through the 'load ROM file' instead of the
  'load binary file'.
- Some Oric files could not load properly because the header of the
  last segment did not match the size of the file. This is not any
  more considered as an error.
- Dialog box for loading sectors from a .ATR is now working fine.

Am I understanding correctly that LBA assigns a straight 28-bit number
to each sector on the drive? Using this mode, would it be possible to
avoid the slow Cylinder/Head/Sector calculations and simply add some
kind of partition offset to DOS's sector number and pass that to the
drive?

Guess I'm out of luck...
The only floppy I can read is disk #2 out of 4 and it only shows the PRO
directory...
Is BBS Express Pro in the public domain and available in ATR format??

Thanks,
Jay

Hmmm, this is odd. I can't see the disassembly or the equates. I can
save the disassembly to disk but I can't see it within DIS6502. All I
can see is the segment list and the dump plus two empty windows.

Has DIS6502 1.7 been tested with Windows 98SE because that's all I use?
 1.6 worked fine.

The list of new features sounds great.

No... The software is still licensed and is being sold by Lance w/ Video 61
I believe. However, Steve Carden has developed TCPIP Express and can be
reached at ExpressPro.DynDns.Org port 8888 or 8889. He sells the latest

version that is Telnet capable.

I tried at one point to purchase an update from Lance and never received a response.

Thomas

P.S. Maybe someone on here would want to transfer ownership of their node to you.

Eric saw your question and asked me to post this reply (I haven't see it
myself):

I read a reply to your post on comp.sys.atari.8bit. The guy says he has
nothing displayed in the different windows of Dis6502. I know this problem.
It is the font which is not loaded. I had the same problem yesterday. This
is often when you run several version of Dis6502. One of the version does
not unload the font. Then when you run another version, you see empty
panels in the main window. I had to reboot my PC to get the display back.

Hi everybody,

I just got an ITT TV2466 stereo tuner. It once was intended to watch
TV with an Atari monitor. Unfortunately, I don't have an instructor
manual.

Now, I want to use it with my TV! I have an old TV with only 8
channels - much too view for the 20 channels that the cabel company
provides.

- I would like to use the TV2466 limilar to a TV receiver of an VCR,
where the eight channels are switched to the one channel of the TV
tuner. Is this possible? How to find the channel of the tuner?

- What is the meaning of the LED's. OK, I guess the left one indicates
that the tuner is set to a channel and the right one indicates
mono/stereo. But what to the upper and the lower indicate?

Thanks, Uli

I have been lurking around this group for the past 4 years or so just to keep up on current atari events. Well, when I saw things such as the USB cart project, the various IDE mods, and Mr. Tucker's flash cart, I decided to dig out my trusty old machine(s). 130XE, 800XL, original 800...

Well, now with all the crap I have stuffed into my 130XE, it has become a massive hassle to swap carts and reboot the little bastard. So I am looking for disk based assemblers to use.

All I have is the original assembler-editor by atari, and the macro assembler on disk. I am missing the manual for the assembler. I have no clue how to use it. It would be nice if anyone knows where I can find scans of the manual, or anything on it, really.

I'd really like to give the mac65 assembler a whirl, but is it even available as freeware?

I'd like to know what you guys would recommend for a good/decent assembler.

Also, on a side note... is there a version of C available for the atari (hopefully disk based also). So far, the only thing I have really seen is cc65, but I'd rather code on an actual 8-bit. I have it, why not use it?

Thanks guys,

I'd try again. I've bought some CD collections from him, and had no
problems with him responding to e-mails at all.

Maybe just a bad karma day? :-)

Mac/65 is included in the Pooldisk collection - I don't know if that makes
it free or not. There are multiple postings of the manual for it out on
the web. You can find a collection of assembly disk images here:

http://www.slor.net/a8/asm

If anyone has copyright on any of them and wants them removed (or if you
know someone else will), please let me know ASAP so I can take care of it.

No manuals for either? You may want to find a copy of John Harris's MAE.
There's also A65 and I believe at least one assembler that comes with
the CC65 distribution, all disk based. There were a few tutorials in
Atari magazines, most of which are online, but I don't have the specific
  issues. Maybe someone else can help on that.

IIRC: A65 and AMAC don't use line numbers. All assemblers are
indentation sensitive to interpret commands. If you have a specific
question I or someone else in the newsgroup could answer it.
>
> I'd really like to give the mac65 assembler a whirl, but is it even

Yes, the disk based version is freeware and comes with DDT debugging tool.

> I'd like to know what you guys would recommend for a good/decent assembler.

Any of the above are good.

I really loved Speech Technologies TASM on an old '286 back in the days
of MSDOS. You need a method to port the code over to the Atari. I used
both disk transfer utilities and SIO2PC to get it over back then.
Nothing quite like using an IBM editor in 80 columns and compiling 10k
of code in less then 2 seconds on Tandy 1000.

Look up Michael Current's FAQ. It has all the languages available for
the Atari.

Thanks for the speedy reply but my problem remains today (yes, after a
reboot).

Ooh! I see you have SynAssembler XL.

I remember dumping the Assembler/Editor Cartridge in favor of
SynAssembler (the 400/800 only version). It was fast and easy. I can't
remember all the features it has but Load, Save, ASM, Find, and Dir
commands are pretty straight forward.

I don't recall SynAssembler being a Macro Assembler but I'm not sure.
All the stuff I did 20-25 years ago was pretty simple and I don't do
any assembly now.

Thanks for the post!

Stephen Sheppard

Lol. Maybe I should have specified... I have the manual and errata sheet for the Atari assembler cartridge and have been using it religiously for the past 15 years, but lack the assembler manual for the AMAC. I bought the AMAC off ebay a couple of years ago and the only documentation I got with it was the "Atari Program-Text Editor" manual, and the reference card. On one side of the card is the reference for the macro assembler, and on the other side is the program-text editor. I just need to get ahold of the manual for the assembler itself.

First off, I admit I am somewhat of a Linux noob, so please bear with my
ignorance of the penguin...

Ok, I have been using Linux for about 3-4 months as a server machine and
before the Linux install, this machine ran APE for my 8-bit. I'd really like
to use AtariSIO so I don't have to reboot the box to Windoze just to use my
disk images on my 130XE.

After bumbling my way thru multiple install problems with AtariSIO, (I was missing my kernel headers, as Mandrake/Mandriva doesn't install them by default, along with a few other minor frustrations.). When I "modprobe atarisio", I get "FATAL: Module atarisio not found."

I'm not sure what's going on here, and I was hoping one of you gents use/have used AtariSIO and can give me a clue as to what's going on.

Not sure if this would be considered OT or not... I apologize if it is.

Not sure which version I had; it did not support macros. There is
a
manual on atariland.com. I never did learn to add run/init

addresses with
the Target File option.

Here's information on an new retro magazine you all may be interested in:

The Digital Alternative is an interactive magazine presented on two professionally produced CD-ROMS covering retro / alternative computing and gaming at its best. Each issues, supplied on 2 CD-ROMS, will have over 4 hours of video footage and over 200 pages of articles covering all aspects of retro and alternative gaming/computing.

The retro aspect of the magazine coves home computers and consoles from the 1970's, 80's and early 90's which basically means every retro format you can think of. There will also be alternative content, meaning contents about the CPC-NG, Commodore One etc.

The cost will be 5 Euro (US DOLLARS: $6.10 or STERLING: £3.40) plus the cost of postage and packaging.

We are ready to produce the launch issue but first we need the number of CD-ROMS and Inserts to produce. So if you're interested then register your interest at http://www.digi-alt.net If interested it's important to register your interest as not to under/over produce the CD-ROMs. We plan on finding the number of people interested (by registering their interest), add 10 percent, round it off and produce the result.

You can go to the main site http://www.digi-alt.net to find out more information on the contents of the first issue.

Regards,
John

Thanks.

I have this odd suspicion that the text is there but for some reason
it's the same color as the background.

I must be looking in the wrong place. I'll keep trying.

In the interim I was looking at SynAssembler articles at
Atariarchives.org and learned that there was an enhanced product, F-S
Macro Assembler 40/80, which was compatible with SynAssembler. FSMA
40/80 was disk based and supported 80 columns thru software.

Now I'd really like to find that!

I spoke too soon :) In using the Ape/ProSystem, I had a glitch when I made
my image back-ups of the master disks.
But now all is great! I re-copied my floppies to a new image file, then ran
APE and made a 16 meg image and copied the floppy images to the HD image and
now in the process of seting it up...
It's an old version of BBS Express Pro version 1.0 :) But still works ok...

In the past I also owned/ran BBS Express ST! I wrote 2 programs for it,
"The File Transfer Utility" or FTU and the first script de-compiler that I
posted on Mark's Board (The, then owner of BBS Express ST!)
Now that I have an Action Cartridge, I might get back into pogramming for
PRO...

I didn't know there was ever any support for the Appletalk interface with
the Falcons' built-in LAN.

There are a couple of routes people are taking as far as networking goes:

1. EtherNEC - cartridge port based.
2. EtherNAT - true ethernet support, as well as USB stuff. Not available
just yet, but very soon now.
3. Seems like I've seen some people mention using null-cables to a PC as
well. Not sure.

HTHs.

The Encyclopedia of Game.Machines

With 224 pages, 600+ full colour pictures, This is the ultimate
reference!

Exactly what it says! This is The Encyclopedia of Game Machines!!
Winnie Forster's unique and aesthetically perfect publication is
presented here in in the UK for the first time.
This book was officially launched at CGEUK 2005. All copies were
snapped up within minutes (literally)!

>From Atari to Sega, from Apple to Nintendo DS: The full colour book
takes not a regional, or European, but a global view on 33 years of
onscreen fun and interaction and presents hardware from Japan, USA, UK,
France, Germany and Korea, along with classic software in its
authentic, pixellated glory. Other than the 600+ pictures, exclusively
shot for the

Game.Machines book, it contains extensive indices, as well as 20 pages
of technical data and explanations.

Available in the UK now.

Jess,

I never did find it by navigating from the Atariland.com homepage but
Googling got me to the manual.

Why does "oldatarian" sound familiar to me?   hmmmmm.....>

Thanks again.

I wrote a simple web utility for my own use that displays a listing as
a web page.

It is at http://www.leehanken.pwp.blueyonder.co.uk/atari/

I'll look into the above... Thanks...

I've also thought about porting FoReM over to the pc and make it a
"multi-node" BBS through Telnet..
I started developing an "Internet Express BBS" version of BBS Express a few
years back, but after a
plane accident, I put it on hold... Another thing to bring out of moth
balls :)

Jay

The 8-bit cluster revisited...

Well, no one seems terribly keen on creating an Atari 8-bit cluster but
somebody has taken the effort to create an Apple IIe cluster.

Check it out: http://members.aol.com/MJMahon/CratePaper.html

The AppleCrate Apple IIe cluster.

Truly inspiring and, um uh, amazing! :)

Don't know if you were ever able to source the 1050 drive shells that
you were after, but I have one that I can let go for $6 plus shipping.

Email me if you're interested.

Hi, I'm Ben Smith here in Portland, Oregon USA! Proprietor of Bravo Sierra
Computers! Occupying a unique niche in the Atari World! Most Atari Dealers
sell NEW, I also sell Used Atari Goods! Not only do I sell NEW Atari Goods
at a competitive price, I also sell used Atari Goods you wont find at Swap
Meets, Thrift Stores or Auction Sites! And I sell for less! Unlike those
remaining anonymous! I test Goods before I sell them. Not only can I sell
you some Great New stuff! But I can sell you hard to find 2nd Hand Goods,
because I'm the guy people goto to give Ataris a New Home! Saving Orphaned
Atari's from Oblivion!Goto http://BensCatalogs.Atari.org or (503)256-9974!

I've got a fast turnaround rate. Usually, Once I receive payment your
order goes out the same day. Customers love the speedy service! I have
lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or
Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/
Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at
http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received
Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify
Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

When you have built the module you have to copy it (using *.ko)
into /lib/modules/(whatever your kernel version is)/ then run depmod -a.

Good luck,

Mark

I tried to download the stuff some kind guy pointed me to. I installed the
Perl thingy, but nothing is happening when I try to start the script.
Somebody must have made an easier way than this for getting the Atari music
files to normal Atari format?

Any pointers on what to do with the perl script thing or some nicer utility
to unsap with?

Take Atarian care

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

Wasn't the wiring list clear in my first post? It's really as easy
as I wrote. But I can create a more verbose description if you like.

Concerning the IC sockets: just use standard high quality sockets
with turned pins, eg Farnell product number 738610.

so long,

Hias

> atarisio", I get "FATAL: Module atarisio not found."

When you do "make install" the atarisio.o / atarisio.ko module should
be copied to /lib/modules/<kernelversion>/misc. Have a look at
the output when doing "make install", you should see a line

install -o root -g root -m 644 atarisio.o /lib/modules/2.4.30/misc

or
install -o root -g root -m 644 atarisio.ko /lib/modules/2.6.12/misc

(The second line in case of 2.6.x kernels)

Maybe your distribution doesn't look in /lib/modules/<kver>/misc,
in this case just move the atarisio module into the
/lib/modules/<kver>/ directory and do a "depmod -a"

You could also try to do a "modprobe -v atarisio", on my Debian Sarge
box running kernel 2.6.12 the output looks like this:

modprobe -v atarisio
insmod /lib/modules/2.6.12/misc/atarisio.ko port=/dev/ttyS0

I only had a link to some terrible scans plus I forgot about your
request. Sorry for the delay.

Here is a source of high quality schematics, drawings not scans. In the
file 400.ZIP you will find diagrams for the original 400 8K and 16K
memory modules. The memory modules are the same for the 800, BTW.

Wow - I've bought from them several times and never had a problem. Always
got what I ordered. BTW, VSWMORETP is "Software and More". They used to
operate at http://members.aol.com/SWMoreTP/HOME.html but moved to eBay.

I'll be on Auburn Blvd. next Thursday, and will stop in.

Anything you want me to ask?

That wouldn't be the bell and howell box that he was selling on ebay would
it? The description was quite clear to me, B & H BOX. I wouldn't expect a
computer inside.

Remember Letter Perfect from LJK?

I've acquired a couple original copies of Letter Perfect in recent years, thinking they would be good to have around as backup copies since this was my word processor way back in high school. I still remember this being such a rock-solid piece of software (in comparison to, say, AtariWriter 80, my word processor in college).

Anyway, I just noticed that there are version numbers on the backs of the disks. One set says V6.02 while the other set says V6.05.

I know there were many earlier versions before 6, as well as cartridge releases, but I don't remember ever being aware of different versions of the disk-based version 6.

Anyone familiar with different revisions of Letter Perfect 6? What was improved or fixed? Anyone know what the last version was?

-Michael

Hello All,

This week (until 26 August 2005) I will be offering the DGS Atari 8-bit
CD-ROM (commercial and PD combo) for the special price of $7 (2.50pounds for
UK buyers), which is a $3 saving on the usual price. This price includes
Airmail shipping to any country (first class post for UK buyers).

If you don't already know, the CD contains most of the DGS commercial Atari
8-bit products and the full DGS PD library (191 double sided disks). The
commercial products include the PPP products QUICK programming language, SAM
80-col GUI (no extra hardware required), and games, along with the
Digi-Studio digitized music package, all 26 issues of the DGS newsletter,
and more. All products are in both DCM and ATR format, and have PDF versions
of the manuals. A copy of the video we shot at the 1996 AMS show is also on
the CD in MPEG-1 format. Full details with descriptions and screen shots are
available on the offer page (shown below).

This offer is for readers of this newsgroup, so to get the special price you
will need to go straight to the offer page:

http://www.dgs.clara.net/cdrom-a8.htm

Payment is by PayPal only, and there are payment buttons on the page. If you
prefer, you can PayPal the money directly to me if you don't like using

direct payment links.

Please be aware that this isn't some sort of trick or con, and I'm not intending to run off with your money! Despite the fact that I've been trading for 17 years, people still don't seem to know who I am. There's plenty of background info on DGS on the main part of the website, and there's also a link to an independent review of the CD.

Dean Garraghty

>this weekend's Dallas vgXpo show

And this is the first I am hearing of a game expo in Dalllas?!?!?
Crap!!! If I had known as little as two weeks ago, I could have gotten time off work! Crap Crap Crap Crap CRAP!!!

Any chance of a 5200 version? This is one of those few games that the CX52 controller would be PERFECT for.

Appeal for any ideas here, I have a 1050, which has the correct voltage at
all the usual test points, but seems to lack power, and I have tried three
different drive mechs with no change in speed. Any ideas where to look next
?

Thanks

Hey! Never thought of that!

No idea if there was/is or will-be a 5200 version. Probably not outside
the realm of possibility, once the XL version is released.
(How's licensing being dealt with with that, anyway!? 8^o)

    I also was the same way. :)   I will be picking ths game up.

    I have often thought that when I pass on and someone looks at my Atari computer, they will see stuff that will fit from the 70's and 80's. And then there will be interfaces and game cartridges from the early 00's (which I call the naughties) and they will say to theirself "What the hell!"

    Glad stuff is still being made for my computer.   :)

    Doc Clu

The voltages at the test points 5v 12v 22v, are all correct as per the SAMS
manual. So the fault is not with the diodes, nor it is the pwer supply.

Any ideas ?

thanks

Also check it with another disk as sometimes the sleeves get a little

warped and drag.

There is VR2<?> that adjusts the speed. Sometimes people adjust these
out of specs so they can write a bad sector.

Hello,

the USB Team, Thomas, Florian, Carsten (Harry was unavailable), worked
this weekend (friday to sunday) in Carstens basment to create new USB
Hard- and Software for the 8bit Atari.

We have new Pictures online at:
http://www.strotmann.de/twiki/bin/view/Microusb/ProjUSBConvFourPic

What is new:

 * a new Hex2Bin Converter (internal Tool)
 * a new Version of the USBTEST Tool
 * Support for USB (UFI) Floppies (DOS Driver hopefully available in
   End-September)

More news can be found in the upcoming ABBUC Magazin (look for Hardware
Contest)

The new USBTOOL Version 0.5 will be available on Wednesday, 08/24/05, on
the SourceForge Project Pages (microusb.sf.net).

If you have access to an USB Floppy, an UFI/USB ZIP-Drive or any other
Device compatible with the UFI/CBI Standard, please test with the new
USBTEST and give us feedback.

Greetings

the MicroUSB Team

What's the best text editor (not a word processor) for Spartados. Something
small that can be loaded from the command line and exited and also doesn't

need a boot disk.

I'd vote for Speedscript. I modified it so it would exit to DOS on
RESET, if I remember the original would just re-run itself.
I'm gonna send it to you, you can see if you like it.

why go to all that trouble of sending just the box? If they dont send the
items, there is going to be bad vibes...but if they just send the box, there
is still going to be bad vibes..as another poster said, read the
description...

why would anyone want a B and H box?

I sold my 130xe a couple years ago and I have regretted it. I
recently bought a 65xe on ebay (won the auction today) I paid 5
dollars plus 15 shipping. that is 20 bucks total, is that about
right?

Also are there any easy mods to bring this up to 128k or higher? I
plan on making or buying a SIO2PC cable and using an old laptop as a
slave with every 8bit game ever made on it (I have every game ever
made for the 8bit on one full CDR which I will copy to the laptops
hard drive) will the SIO2PC software work with Windows XP as well as
the older versions?

thanks !!!

Kevin

I like Ken Siders KEDIT. I use it for my Forth Sourcecode (USB Project).
Works very good with SpartaDOS, BeweDos and RealDOS. The only thing I'm
missing is an open source editor (or the source for KEDIT), so that I can
tweak the editor to jump directly to Forth and start compiling :)

KEDIT can also be put into an AtariMax Flash Cart and can be started "from
ROM" from the SpartaDOS Command Line.

From the KEDIT Webpage:
"Text Editor designed to accompany
KASM65. Features 40/80 columns on screen. Horizonal scrolling ACTION! type
editor. Keyboard macro capability. Version 1.51. Version 1.53 will be here
soon (24699 bytes)"

Just an opinion but if you get an SIO2PC cable you will probably want to
rethink expanding the memory. I/O is fast enough that even many older
games that were a pain to play with all the disk access, like Ultima
III, run quite well.

Not really. Many items are worth more with the box intact. In some
cases, even double the value.

Cheers,
Mike T.

There are plenty of options for converting ascii docs to atascii and vice
versa. Along the way, has anyone written a simple atascii file viewer for
the DOS or Windows? Or, in my Xanadu, a simple viewer that can detect
either format and display it properly for viewing?

thanks

yes, I have tried them in the past and know exactly what you are
saying. unfortunately tho that makes the resulting translation little
more then useless. but yes, we do have to entertain ourselves from
time to time. :)

> cases, even double the value.

The box, it's value - it's all perception based. Most collectors of these kinds of items are somewhat obsessive-compulsive. They want to complete a collection, they seek to have something the other collectors do not. The reason anything has value is because someone out there wants it or it would be worthless otherwise. I don't mean that like it's a bad thing, merely that it's a reality.

Besides - that box looked like it was in pretty rough shape.

From a collecting standpoint - MHO is that an item like the B&H box is only worth something if it matched up to the computer that came with it (BH with original packing container), or if it had some historical or special value. Maybe... "B&H Apple II box, originally hand-packaged by Woz himself - has small blood stain from where Woz accidentally nicked himself with the packing tape dispenser. Proof of DNA on file, will provide Certificate of Authenticity. Clone your own personal Woz."

Ick!

SIO2PC does not work very well with XP, SIO2PC being a DOS application
which needs direct control of the serial port.

There's Windows APE, which works great but is not free. 30 day trial
then you need to register.

There is also Atari810 for Windows NT/2000/XP, I think. Don't use XP
so I don't use it.

AtariSIO is great but it's for Linux. There's also a floppy/CD
bootable version. Can access FAT and FAT32 partitions. Don't know
about NTFS. The author, Matthias Reichl, hangs out at this NG so he
can answer any questions.

I use AtariSIO a lot. I have a nice bootable CD which uses a script to load random games, one CD for ATRs and one for binaries. Don't even need a hard disk. This was a nice way to use some of my ancient hardware.

Sometime I'll get around to loading the full Linux version of AtariSIO (but then I'll have to try to learn Linux again, yuck!).

All the Atari disk emulator programs work with a standard SIO2PC cable except AtariSIO does not work with the original 2-chip SIO2PC, Max232 design cable. Works great with a 1-chip MAX233 (easier to build than MAX232) which I chose to build when I wanted to use AtariSIO.

I don't know how I missed beta 6.

I Haven't tried it yet (beta 6 or 7). Hope the break key issue of beta 5 is fixed.

Does anyone know where I can get the CD/floppy bootable version of
AtariSIO? I searched for it last week a little but couldn't find it.

You would need more than 64K to use Mydos and configure it for the 800.

I assume you are refering to using the ram above 48K for a ramdisk in a 64K
800(400
too I think).

You get about 100 free sectors.

You have the right power supply.

You are using a TV, so pressing ctrl + 2 does not buzz?

Holding START and turning on the XL does not produce a buzz?

Then its the cpu, pia, ram, or OS rom most likely.

Do you mean it isn't running at 300 rpm? Is slow to load/save? (That speed it
typically about 800 bytes a sec).

I got most of my copies directly from Hias but he said I could
distribute the AtariSIO boot disk to anyone who asked.

Check you email!

What can I use to disassemble OS ROM files? DIS6502 won't allow it.
Am I overlooking something obvious?

At the moment it's still quite experimental and I haven't released
it officially. If you are interested, contact me by email and I'll
send you the latest snapshot.

so long,

Hias

I don't believe you are overlooking anything. There is a feature request
open now for allowing rom disassembly. So, perhaps in the next release!

Slight correction here, 810/815/1050 drives run at 288 rpm, not 300.
Running them 12 rpm faster can cause read/write problems.

I've used da65 (part of the CC65 suite http://www.cc65.org/) to
dissassemble roms in the past. It's not as nice as DIS6502, but it works
and it doesn't matter what type of file it is.

The 800 OS most probably zeroes out the PORTB register during startup,
thus making the 800XL hardware to switch off the OS ROMs.

There was another thread here, maybe find it through the Google Archives,
where someone was saying that, and had the procedure for guaranteeing that
it did not switch off. can't remember the details, but the OP can surely
look for
it there. If I have a chance I'll see if I can find it and repost it. :o)

Here ya go folks. I found it in the Google
Archives. Hope this helps. I may try this one

day myself, even though I like the XL the way
it is, and also have a 400. :o)

    This is a interesting question. I have to agree with the Commodore
    statement. Most of the Atari scene was... let's just say homophobe is
    approaching correct here. :)

    That said, you could try lantern (gif) and the JPG viewer on the Atari and
    show (after converting them to work on your computer) some of your favorite
    pics.

    Now I might have one file I can send now I think of it. A game that was
    made with the pinball construction set. Send and E-mail greg.goodwin (at)
    r d f i g (dot) net.   I'll send that file to you.

    Doc Clu

Not as far as I can tell. Google '"dave small" atari'. The second link
was "Where are they now?" The server for that link was down;
archive.org says it was last updated in April 2004.

That page
<http://web.archive.org/web/20040405210412/http://www.toyz.org/mrblog/archives/
00000115.html>

points to an AtariAge forum thread from 2001.
<http://www.atariage.com/forums/viewtopic.php?t=9183&highlight=spectre+gcr>

Found an AOL page with a photo, but I have no idea how recent that is.
<http://hometown.aol.com/davetracer/index.html>

The AOL page doesn't mention Atari at all, but it came from his AtariAge
user profile.

If you ever revisit this project, check out the "Homemade Translator"
in Analog magazine. I think it was done by Angelo Giambra (sp?). It
had a complete procedure, and IIRC had some technical details. I know
that the translator worked well, and *I think* years ago I burned the
resulting tranlator into a 27128.

> with the Option key. But they are minor problems. The OS unpatched should
> work.

PIA ports are programmed as output by default, i.e. after power up. The
OS zeroes I/O registers starting at minor addresses and proceeding
towards higher addresses. So it first zeroes $D300, then $D301, and
after that there's no next instruction to execute, because the XL

hardware switched these addresses to RAM (bit 0 is cleared = no ROM).

The XL OS does pretty the same thing, but first it zeroes the PBCTL
register. This prevents the bad thing from happening, because after that
the PORTB is in the data-direction-register mode and its changes don't
affect MMU state.

The unpatched 800 OS does not have any chance to startup on XL hardware.
  I don't see a reason why anyone could want to use that anyways.

K.

The 12V supply is the most frequent fault. Atari used a voltage doubler
and the diodes in the middle of the BIG capacitors come loose from
thermal shock/over heating.

There are a few other things that are likely. The 1050 should have the
drive busy light come on everytime you close the door latch.

What you should try is having the drive on, a disk in it, and hooked up
to the computer. Turn on the computer and see if you get an abnormal
boot noise like a screech. If it gives an abnormal noise then at least
the computer and drive are trying to talk to each other. If it doesn't
make a difference with or w/o a drive then you have something seriously
wrong like a bad disk controller chip.

No, they are input in the power-up or reset state. This is described in
the datasheet, and it's the normal behavior for every I/O port chip that I
know. If the default state of any data port would be output, then it might
provoke all kind of damage including short circuit if the design is to be
an input.

> The
>OS zeroes I/O registers starting at minor addresses and proceeding

This is completely harmless because (as explained above) the ports are
programmed as input. Furthermore, it is actually a NOP operation because
all PIA registers are zeroed automatically on reset.

>The XL OS does pretty the same thing, but first it zeroes the PBCTL
>register.

Again, PBCTL, as all other PIA registers are already zero after reset.

> The unpatched 800 OS does not have any chance to startup on XL hardware.

If you would have read the whole thread you would have see that the
original poster did run successfully the 800 os in XL hardware. He got the
memo pad. The reason that it wasnt working for him before is because he
put the OS in the wrong EPROM location.

> I don't see a reason why anyone could want to use that anyways.

To have a translator in hardware, that's the reason.

Ya could always brute-force it. There was a cool Crosswords puzzle creator
for the Atari that was published in a Compute! book or something somewhere.
I'm sure it was at least slightly more intelligent than anything I'd code
for creating crosswords, but it seemed to try until it gave up.
"I can't make a puzzle out of these words!"

I think it was in BASIC with machine code bits for doing the hard stuff.

...I can't figure out how to make the gumballs come out faster.

I can get past the first two levels but on the third level even if I
catch every gumball correctly I simply can't collect enough gumballs
throughout the "day" to meet quota.

I remember being able to speed up the machine, but I've pressed every
joystick button and every keyboard one as well and can't speed up the
machine to save my life.

Does anyone remember how?

Thanks...

Push the joystick up and down to control speed of production.
Watch the guage just under the conveyor belt.

Hi all,

There is source code from a M$VB project that is available on the
internet.

I can send the zip file to anyone who wants it, Although you will need
VB to view it...

Rory

Thanks Sid. When switched on the power light comes on. Everything else
has no effect. Opening and closing the gate, inserting and removing
disks and attaching and booting to an Atari have no effect. At no point
does the drive attempt to spin, illuminate its busy light or move the
heads. The Atari never recognises an attached device regardless of the
position of its device switches. It just remains silent and still.

In fact if it wasn't for the power light the first thing I would have
checked would have been the plug!

If the power doubler diodes have failed would the power light still
illuminate or does it take it's juice from after the power doubler?

Thanks again everyone!

Hello All,

I currently have a variety of Atari cables as 'buy-it-now' on eBay as
follows:

* Atari to SCART 1.5m - 3.50pounds
* Atari to RCA (2 audio lines) 2.0m - 2.99pounds
* Atari to RCA (single audio) gold-plated 1.0m - 2.00pounds

All prices are excluding shipping.

I can ship to the UK, Europe, US/Canada, and Australia/NZ.

Full information is available on each listing, which can all be found at:

http://search.ebay.co.uk/_W0QQsassZdeangarraghty

Hi Dan,

I'm currently reviving a german forth called "VolksForth". This Forth runs on 68k CPU (Atari ST), Z80 CP/M (Amstrad etc), 8086 (MS-DOS) and 6502 (C64, C16, Plus4 ...)

This Forth is based on Forth 83 Standard. Is includes fairly modern things like heap memory management, multitasking and a file interface.

I'm porting the 6502 Version over to Atari 8bit. It's curretly running, but the fileinterface needs to be done.

There will also be new versions for Apple II, Apple 1, Commodore PET and maybe VC20.

Also currenlty the 200+ pages handbook is only in german language. This has to be translated into english.

Ciao

Carsten

Does anybody know where I can get the Supra hard disk utilities disk? I'll
take a copy in ATR or it's original format.
Any info on this disk would also be very helpful. Thanks.

Then again, this is their 520ST list. I didn't notice that when I found
the link.

Creating the solution would be pretty easy. Showing just enough numbers to
solve it but not giving away too many might be more difficult.

For those that don't know, Sudoku is a 9X9 grid, where each column, row, and
3X3 square contains one of each number 1-9. It would be easy to randomly fill
the grid, but then you have to reveal enough numbers for someone to solve it.

My apologies if this appears twice. The first attempt does not appear to have made it through...

Version 1.6 of Eric Bacher's interactive 6502 disassembler has been released. This release is a port to Win32 with a few bug fixes and a number of new features. You can now find the latest version at its new home:

http://sourceforge.net/projects/dis6502/

We hope those of you who remember DIS6502 from back in the 16-bit Windows days will grab this new one and give it a run. Make sure you take a look at changes.txt for release notes, and please enter any bug reports or feature requests in the project tracker on SourceForge.

Thanks!

AtariAge.com reports:

  Atari 8-bit Sinistar Prototype Discovered!
  http://www.atariage.com/index.html#5135

    "Fans of classic arcade games are all too familiar with the roar,
    'Beware I Live!' A long, lost prototype of the beloved (and difficult)
    arcade game Sinistar has been uncovered for Atari 8-bit
    computers. Thanks to the hard work of Atari Archivist Ken Van
    Mersbergen, this unreleased arcade to home conversion has finally been
    found. Sinistar combines fast action, mind numbing speed, and evil
    sounding voice synthesis into one explosive package. Your goal is to
    destroy Sinistar, a giant metal creature bent on destroying the
    universe and whatever else that gets in its way. However, to destroy
    Sinistar you must make Sinibombs out of Sinisite crystals harvested
    from floating plantetiods.

> "The Atari 8-bit version is a wonderful port, capturing all the
> action and excitement of the arcade game. The graphics are amazingly
> accurate, the controls are sharp and precise, and the digitized voice
> rings out loud and clear. Sinistar was just about finished, but there
> are a few minor issues and bugs that needed to be addressed before the
> game saw a commercial release. The biggest issue is the computer AI,
> which isn't quite polished. Sinistar will be displayed in public at
> this weekend's Dallas vgXpo show, and plans are to release the
> Sinistar binary in the near future so everyone can enjoy it. You can
> read a thorough review of Sinistar over at AtariProtos.com, and
> discuss this exciting find in our Prototypes Forum."

You can learn about it, and see lots of pretty screenshots, here:

  http://www.atariprotos.com/8bit/software/sinistar/sinistar.htm

> "So why wasn't Sinistar released? Around the time Sinistar was
> being completed (mid 1984), the video game market was crumbling fast

Actually, that's easier than making the solution that gets hidden.
Many puzzles I've seen seem to have a symettric pattern, mirrored around
a diagonal going from the lower left to the upper right. [*]

Just pick ~15 positions between (0,0) and (8-y,y) (for y = 0..9, where
(0,0) is top left and (8,8) is bottom right).

Expose those positions, as well as the mirrors of those positions.

[*] for example:

```
  ... ... ..X
  XX. ... X..
  ... X.. ...

  ... ... ..X
  X.. X.X ..X
  X.. ... ...

  ... ..X ...
  ..X ... .XX
  X.. ... ...
```

I'm far from an expert, though... A coworker showed me the game recently,
and since then I've been noticing it many other places, so have picked up
a very few things. Only actually played a game once. (I'm have pretty
bad attention skills :^))

Hi,

> If the power doubler diodes have failed would the power light still
> illuminate or does it take it's juice from after the power doubler?

No, it takes the 5V pass from the power supply, not the 12V pass via
the voltage doubler circuit. Thus, power is lid regardless of the
doubler circuit diodes. You'll find them in the middle rear part
of the drive, right between three large capacitors.

So long,
     Thomas

Thanks, that's what I remembered controlling it but my joystick, while
moving the bins from side to side, was not controlling the gauge. The
keyboard did work (E and C keys to change speed and D to freeze the
gauge at the desired position).

I mapped the joystick to emulate the keyboard and it is working now.

Thanks for your help.

-Chuck

This is quite cool! I didn't look at the page much (just played with it
for a few minutes on my PAL 800XL last night), but couldn't tell how or
if I could do two-humans vs one-computer mode. Also, [Space] seemed to
pause, but then I was stuck.

OTOH, everything else about this game is awesome. Great animation,
great digitized sound, very pretty background. I remember playing the
original IK on my friend's Amiga.

Filling the grid is easy. It's the clue numbers that cause problems.
They need to lead to a unique solution. A UK newspaper recently stuffed
up big-time, expecting to have to pick a correct answer to their
single solution puzzle. Turns out they'd got the clues wrong. There were
over 170 possible solutions. So, instead of getting a few hundred correct
answers, they got thousands.

Hi,

Bob Klaas was the person to take over the SUPRA interface. I'm not
sure if he sells them anymore, but he would have the disk you require.

I know he also burned the ROMS depending on what drive was installed.
I think they were for disk parameters.

I may have a disk lying around if you cant find one or cant contact
Bob.

Rory

I just went to http://www.websudoku.com/ and reloaded a couple of puzzles.
I feel like a loser that I never noticed the symmetry in the pattern of
exposed numbers! That should make it even easier. I guess I need to start
work on it then, I don't have any excuse now!

It's pretty cool, I usually do one puzzle from www.websudoku.com before I
go to bed.

               Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit
family of computers! These include the 400, 800, 1200XL, 600XL, 800XL,
65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale,
California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:
comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate
binaries groups instead.

I was in touch with Bob Klass years ago. I bought an XE adapter off him. I lost track of him. I would like to get a hold of him (I also need another adapter). Do you know how? Thanks Mike.

And subsequently, rights to all K-Products products were obtained by Video 61.

So even though I don't see the disk listed at www.atarisales.com I'd suggest
giving Lance a call.

Of course its easier, but its not the same.

Some programs dont run with the Atari Translator, or any other software
based translator. You can't use the translator with most cartridges, which
is what he wanted to do. And besides, it is much better to have a
translator in Rom than booting one from disk.

   On Fri, 5 Aug 2005 at 07:21 -0700, lbaeza scribbled:
->I'm really impressed on how robust old hardware is.

   When I got my first Atari 400 my computer mentor said, "There's
nothing you can do to mess it up." No matter how much you might
"mess it up" via keyboard inputs, all you had to do was turn it off
and on again and it would be as good as new.

   Compare that with how far we've progressed with computers in the
last 25 years: with Windoze the OS is struggling from the first mo-
ment to get out from under its own intrinsic mess; if you're lucky,
it may run in spite of everything Microsoft has spent years and years
messing up; but if you mess it up or some hacker halfway around the
globe writes a good worm or virus, you start feeling you'd have been
better off staying with the good ol' Atari 8-bit.

->They don't do machines like that anymore...

   You can say that again.

->PS: I think I learned a lot with this machine. It was worth it.

   Think of all the spare parts you've gained. <grin>

How many people will be attending this year? I haven't gone for a couple
of years just because the $4 to get in seems a little steep for how
small the show is.

Anyone here going? Bringing anything cool?

BTW, here's the website:
http://www.angelfire.com/oh4/acec/acecswapmeet.html

    But it goes to a good cause. :) I doubt ACEC has many other
  forms of income to keep the club going.

> Anyone here going? Bringing anything cool?

    I'm going to head down for sure, hopefully to buy plenty of
  cool stuff myself. :) The last time I was there a woman had two
  nice condition ST notebooks and I'm still kicking myself for not
  picking one up.

You mean she had -2- of the ST Book? Wow, thats impressive, considering
how hard it is just to find one...

Are you going to show anything (MyIDE+Flash or USB Cart)? If I had
more time I'd love to show off some of my stuff (including my ST
Book) but it's at a bad time for me in September. Maybe I'll have
to re-think it this year...

I was going to try to make it if I am off.

Doc, Neochrome came packaged with my ST and had some very nice sample pictures
included. Still runs great on my STe.

I have a few issues of Current Notes, but not the ones you need.

I remember Dave sending them to me free along with some 8-bit software
that was fairly new at the time. I exchanged a few letters with him and

he has a great knowledge of Atari.

It would be nice to see Current Notes up on the Web or at least
Daves' stuff.

Also, gotta mention Ben Poehland The 8-bit Alchemist!

I also remember a story about him at one (admittedly at a late date in the
Atari glory days, but still!) show going down the aisle giving away the
spectre stuff for free to the audience.

> Good going. I was only mentioned in one issue.

Hey, got a copy of that? I'd certainly be interested in reading it! :-)

It was just a one-liner stating that I was into MIDI. Not too interesting, but
I was happy just to have something in the issue.

I just picked up a used atari 800 and I'm wondering how much memory it
has? Is there a way to run a basic command to tell? I opened it up
and examined the slots, all are in use with unmarked boards full of
chips. Any help is appreciated.

Thanks,
Skrim

? peek(88)+peek(89)*256 will tell you how much memory is available for
user programs.

8KB (8192 bytes) are used by the BASIC cartridge. 960 bytes are used
for screen memory.

The maximum normal memory for an 800 is 48 KB, 49,152 bytes.

The BASIC instruction above should yield 40,000 for available memory
for a 48K machine. That's 49,152 minus 8192 minus 960 equals 40,000.

Genuine Atari 400/800 memory boards were originally wrapped in shell
which had makings as to their size.   Even bare Atari boards had
markings on one edge, either "8K" or "16K". You'd have to take these
out to see the markings.

If you have third party memory boards you could possibly have a
RAMDISK. The above test would not tell you whether you have one or
not. Not sure how you could tell that short of taking the boards out
of the system and examining them.

I have a dozen or so bare 32K Atari ram boards if anyone needs one.
Guess I could build a few if you want one and can't solder. I am told
though that they may need some modification to work, as they are 3rd
party boards.

PEEK(89)+(256*PEEK(89)) is $9C40 or 40,000, the bottom of
screen memory or $A000 - $3C0 (960 bytes of GRAPHICS 0, under
the BASIC cart, the display list is maybe 30 bytes under screen memory.
Since you're doing PEEKs, you would be better to use FRE(0).
? FRE(0).
This will give you about 33294 if you have 48K, and I guess 8192
less for each 8K less you have. I would guess, since all your slots
are full, that you have the front 10K ROM, then 3*16K cards, for 48K.

No, I Stephen is right. If you have less than 48K memory,
you will have a lower bottom of screen memory. Sorry.

Still looking for a Magnavox Professional RGB Monitor that has
the LIN RGB (ST-Falcon connection), TTL RGB, VCR Button, and
RCA jacks for connecting an Atari 8-bit.

These were also made in another name or two such as Philips RGB.

I will consider a broken one with a bad tube as my tube is fine.

Contact me if ya have something that may work.

And no I'm not spending $150.00 plus at BRAVO Computers.

Thanks,
phantomm@bellsouth.net

Are these 800 only boards? Would they work with a 400?

Bye Jochen

I'm not 100% sure, but I believe them to work in the 800 only.

If it runs as a standalone memory board in an 800 then it should run in
a 400.

If it needs the support of a genuine Atari memory board then it won't
work as the 400 has only one memory slot.

Wasn't there a Mosaic 32K board for the 400? Are your boards based on
this design?

If it runs as a standalone memory board in an 800 then it should run in a 400.

If it needs the support of a genuine Atari memory board then it won't work as the 400 has only one memory slot.

Wasn't there a Mosaic 32K board for the 400? Are your boards based on this design?

These are Microtek AMB-32 boards. I was informed by Best Electronics that they are 32K boards. They have 16 memory chips, I assume 4116, which I can still get and have quite a few used ones. Bradley also tells me that they may need
some type of modification for them to work at all. I will build one and throw it in
our 400 and see.

Unknown, and I plan to build one just to be sure they will work.
I assume with 16 ram spots that they use 4116's, which would
yield 16 x 2K or 32K. I will let you know. Would anyone like
to test the theory of more than 48K, I will send you a bare board,
you can build, test and let us know. Not worried about cost, just
pay me $2 postage. I had to eat these anyway, and I have about
a dozen of them here. I'm keeping a couple for me. Thanks.

Are there any SAP player for the Atari 8-bit? I have the SAP player for my
Dreamcast with lots of nice tunes and would like to have them on Atari also.
If not, are there any converters to make them CMC compatible?

Thanks and take Atarian care

I'm no expert but wasn't 52K the max for Atari 800 for normal memory.
Needed a RAMROD board for this I think and at fair expense just to get
that last 4K above 48K.

There were Axlon type RAMDISKs which could add bank selectable memory
but those would have been bigger than 32K I should think.

I suppose at it's worth a try.

Off topic:

Has anyone in this group ever built the 800 Plus 256K mod (see below)?
 If so what software can use it?

http://atrey.karlin.mff.cuni.cz/~pavel/atari/800_256K.html

Not as linear addressed RAM. The scoop for your 800 goes something like
this. It has been a long time so I may have some details off.

The 800 has 4 slots. One of the slots must have the OS board in it and
at least one of the other 3 slots has to be memory.

The standard memory boards from Atari were 8k or 16k. I don't think
there were a lot of 8k boards around as they were obsolete the day they
were introduced. There was a Mosaic board with 32k and Axlon came out

with 128k and I think 256k. The advantage of the Mosaic board was you
were able to expand your memory to the full 48k and have a free slot.
Several outfits like Bit-3 made things like 80 column displays that
would work in the free slot. The Axlon boards allowed you to run
software that used the extra RAM as a RAM disk as well as freeing up a slot.

   Perhaps THE reason I still have a ST of any type, and why I did not buy a
   falcon 040 when given the chance was based on the Spectre GCR, Dave Small's
   invention, which I have a website up on.

   I think he was the icon of the fun programer on the ST, and his books were a
   blast to read. I sometimes read the Spectre manual, not even having a ST
   going with the GCR, but just to read the books.

   I got rid of many of my copies of Current Notes, but kept the ones that had
   Dave Small in them. :) Would like to copy those articles and get them
   posted.

   Well, as I learned recently, you could open MyDos, create a ramdisk, format
   it, and then try writing things to it. If they stay, you at least have that
   much memory.

   Doc Clu

Well, it was probably my fault. I tried to run a program on a 1040STE

that was for
High Res only. After booting I lost all power to the monitor.
The Fuse did not blow. And when connected to the power, I get a humming
and
sometimes a faint whistle. near the transformer. To me, that means some
Caps are
blown. Or another componet. But on that side, there are mostly Caps and
diodes.

If I had one with a bad tube, the power supply part along with the front
power switch
will slide out of the monitor. A Cable has to be un plugged and a ground
wire cut.
But thats about it. I plan on replacing the Caps and see if that helps,
but my time
is limited until school starts.

I also bought a like new Mag 80 RGB exactly like the PRO model but
doesn't
have the LIN RGB ST-Falcon port on the back. It has the place for it.
But no
circuitry for it. Everything else is exactly the same except for the Lin
RGB Port.

I Have wondered if the TTL RGB port would work on a ST-Falcon if a cable
could be
made. Does anyone know?

The ports are very similar, both round, but number of Pins are
different. AFAIK the TTL RGB is
for a PC RGB connection. Or maybe an Amiga connection.

I have 2 TTL RGB cables, but no ends for the ST Computer Monitor Port.
One end of the cable looks similar to a 9pin Serial port connector. The
other is round and
connects to the TTL RGB Monitor Port.

The Mag Pro is a excellent monitor. Would buy a working one if price is
right, or bad one
if I can make use of it. Also may trade, Have lots of Atari Stuff.

If someone knows of a similar ST-Falcon RGB monitor that will also allow
an 8-bit Atari to be
connected at the same time. Let me know the make and model.

Anyone fimilar with the Twaug Newsletters for the Atari 8-bit?

There were at least 18 issues with Disks. I was wondering if they
went beyond issue 18.

The Years were from 1993 to 1995.

Issue 18 was the last issue I got and it was dedicated to David Ewens,

who was a founding member and passed away.

He was a great guy and sent me the mags for Free.
I remember exchanging letters with him before, I got on the Net.

These are some of the best Atari 8-bit newsletters I have ever seen.

Full of tips, hints, projects and etc.

I think I have all the disks, but am missing the paper issues #1 and #2
and would
like to have for my collection.

The newsletters are like fold over books.

Anyone want to trade/sell ?

Hi,

Was 28 there last issue if ya know?

And do your images include the full Newsletters?

I enjoyed the disks, but for me the info in the Newsletters was great!

Anyway to download them?

E-mail me if ya want to talk in private

phantomm@bellsouth.net

ya know, i just realized that you both (Lance and Steve) are right,
sorta: lance may have and own fte products but so far he's not

mentioned that this included icd products. am i correct? my gosh, i can't get over the the similarities between this and sco / linux. going back through the history, sco (like lance / bob) bought the source code from novell (like mike hohman) but nothing, nothing between them states that this included the copyrights. lance seems to think that because he got the source code he got the rights because mike never paid bob and blah blah blah. he may have gotten the source code for fte stuff, but this did not include copyrights or any sort of agreement which included the copyrights (you simply can't take them from mike because mike didn't pay bob) nor did it include any icd stuff.

I AM ANNOUNCING TO THE GROUP / LIST: I will take apart, reverse engineer, and use any and all icd products (excludiing FTe products) I can in and within my rtdos alt os project (if and whenever it gets off the ground). If Lance wants to stop me then he will need to provide clear proof that he owns the copyrights and not just the source code. He has 30 days to reply and respond (publicly) in a manner that is suitable, legal, and acceptable for this group / list. He has 30 days to provide me as well as all of us that he clearly owns the copyrights and not just the source code. If he or Bob do NOT respond within the next 30 days with clear legal proof that Lance owns the copyrights to all of icd and or fte proucts and these rights WERE signed over to Bob Klaas and or Lance Rhenquist by Mike Hohman then I will take that as an understanding that no such legal agreement and or documentation exists and will continue forth with my rtdos alt os project. Any such action (legal or otherwise) either Bob Klaas or Lance Rhenquist take after the 30 days has passed will be null and void as per this public announcement.

My mailing address for any legal action is:
Jeff Wood
1013 West 28 Street
Cheyenne, Wyoming 82001

And, yes, this also applies to Steve Carden and Mr. Ames (tho I have no use for REAL.DOS at this time, any agreement we may do or may not do regarding REAL.DOS and rtdos will be made public; Just covering my rear here, Steve)

I was wondering if anyone has been tempted to program a SuDoku puzzle 9x9
for the Atari 8bits, with solver solution. This would be a great, fun and
utility program I would like to get.. I have a Microsoft Excel Macro
program that will do it, JavaScript and other modern solvers, but none in
Atari Basic, Action
or other language, but prefer Basic..

I'll take a look at the verticle and horizontial stuff as well and see
if I can fix it or
send it to someone who can. I really need it fixed or replaced.
Heck, I'd love to have 2 or 3 or em.

Hey Dude, Go For It.

Make us some cool 8-bit stuff.

BTW, do you have any info on the 80column adapter for the
1meg MIO? I have a 1 meg MIO with the Video port.

I heard rumors in the past that a few were made. Or at least
some type of proto type exists. Anyone have a pic or doc about it?

Also, does anyone know if the Video port can be used for anything
as is?
If not, what about a second modem port or something?

Guys, I thought I had this URL somewhere but I can' find it now, and
google is sending me all over cyberspace, so...

Can some kind soul give me the URL where I can buy the Ultima game carts?

BTW, which ones were released, 1-2-3-4?

Thanks everyone.

--
_/_/_/

I bought an Atari 600XL some weeks ago on a fleamarket and it seems like
the computer's out of order... can someone help me finding the defect part?

The symptoms are that when I power it up, the red LED on the keyboard
turns on and for about a second the screen has a brown-like color - then
it's black again.
It doesn't matter if I use the HF- oder monitor-output, it's always the
same... the red LED turns on, stays on, short brown screen and then black.

I already pulled out all ICs and put them back in their sockets.

Bye,
    Christian

Could be any number of things.

Electrolytic caps dry out over time, and EPROMs fade (though Atari used
masked ROMs which do not fade).

You'll have to do some probing, see what signals seem active and which do
not.

But based on the screen he is getting it seems to be the processor.

Probably not too helpful, but if you could get some A8 ICs, pull the
big ones and put in a known good one. Figure out which are the
RAM chips, a bad one might be hotter than the others. Try holding
down the OPTION silver key at power on, this will disable BASIC
 and maybe you'll see a blue screen. Then there's purchasing a
logic probe, which won't do you much good unless you have a working
600XL to compare with. I think your power is OK, as the red LED
comes on, should be 5 volts at the power adapter. I guess this is
a PAL 600XL, so things may be a little different from a NTSC one.
Finally, maybe get a 800XL, it is a more useful computer, the 16K
600XL can just about only run cartridges. Good luck.
Russg
get a correct BLUE screen

How does the Axlon free up a slot?

My Axlon 128 sits in the 2nd RAM slot and needs some combination
of 32K
in the other slots for a complete 48K plus the ramdisk

I was just thinking about it for the past couple of weeks. I haven't looked
at the algorithms for creating the puzzles, but I don't think it would be
hard.

Maybe I'll get bored and see what I can do...

Welcome to the comp.sys.atari.8bit newsgroup!

You've found the Usenet newsgroup for discussion about the Atari 8-bit family of computers! These include the 400, 800, 1200XL, 600XL, 800XL, 65XE, 130XE, 800XE, and the XE Game System. Atari, based in Sunnyvale, California, USA, produced this line of computers from 1979-1992.

To see what Atari is up to today visit http://www.atari.com/

NEWSGROUP BACKGROUND:

comp.sys.atari.8bit was created in November 1986, and is unmoderated.
There is no charter for comp.sys.atari.8bit. (It pre-dates that custom.)
This newsgroup was known as net.micro.atari8 from Feb 1986 to Nov 1986.
The earlier net.micro.atari existed from Nov 1982 to Nov 1986.

Please don't try to post binaries in comp.sys.atari.8bit, use the appropriate binaries groups instead.

I was pretty sure the Axlon appeared as 32k just like the Mosaic +
whatever else was in there banked.

I remember having problems with both a Mosaic and Axlon board plugged in
anyway: I think I fried at least one of the boards when I tried this.
That is an Axlon with a 16k board gives 48k, frees a slot and gives a
ramdisk, a Mosaic with a 16k ram board gives 48k and frees a slot, and
an Axlon with a Mosaic invites disaster.

Does anyone has schematics of 400 compatible memory or can point to them?

Hi

Can anybody tell me why do I have to burn the 10K 800 OS at the end of
the 16K 27C128 EPROM? What's the reason for this?

Regards

> His problem, I believe, is he is putting the old 10k OS at the start of

> Are there any SAP player for the Atari 8-bit? I have the SAP player for my
> Dreamcast with lots of nice tunes and would like to have them on Atari also.
> If not, are there any converters to make them CMC compatible?

Sure ! Such a program exist and its name is Unsap :) Unsap has been written by
Fox, author of Numen - the best ever Atari 8bit demo.
Unsap is a Perl Script. If you are using M$ Windows u need to install Active
Perl before use.
Important note: SAPMAKER (http://asma.atari.org/) made sap files can only be
converted by Unsap to their original format (cmc, mpt, etc.).

Here is an URL to Unsap: http://atariarea.histeria.pl/pliki.php?sec=show&id=413
U have to be registered to download the file ! ->
http://atariarea.histeria.pl/forum/register.php

Best regards,

> the 16K 27C128 EPROM? What's the reason for this?

Simply because the 800 OS uses the memory area $D800-$FFFF. OTOH
the XL OS is 16k and uses memory $C000-$FFFF (the part from $D000-$D7FF
contains the selftest and is mapped to $5000-$57FF if the selftest
is enabled).

so long,

Hias

Sure, it is because of the basic design of the microprocessor. When it
is first powered up or reset it starts execution in the $FFxx memory
area. It was just a design decision, other processors may start
execution from $0000 for example.

Since you have to use a ROM in the high memory area it is easiest to
just use a commonly available ROM. That is, you wouldn't want to put in
a 256 byte ROM at $FF00-$FFFF and add a 8k<or 16k> ROMs somewhere else.
Keeps your part count down and simplifies decoding.

Likewise the 6502 always puts its stack on page one and page zero is a
special place for fast executing code. This dictates you have RAM
starting at $0000.

It could be anything. Dead ANTIC, dead GTIA, dead modulator, dead caps in
the video signal path, dead ROM, dead support logic, broken PCB tracks,
etc...

Saying there is nothing on screen is as vague as saying there's a guy lying
down not conscious. Could be a heart attack, epilepsy, drink, sleep,
sunstroke, etc.

Really need a bit more info to go on.

Otherwise we're just working in the dark.

Okay, what can I do for further analysis?

...I am no electrican, but a trained system-electrician (=if it doesn't
work, change the board. If that won't work, change the whole system).
^_^; So the most useful tool in this case I possess and learned to use
would be a multimeter...

My hope was that:
- it would be a well-known problem (since the screen shows a brown-like
color for a second and the power-LED is on - at least it's not
completely dead)
- or that someone could tell me what to check and which values are
expected there
- or that someone could tell me "Hey, buy an Atari 'dunnowhat' since
most of the chips are compatible", because then I wouldn't have to wait
for decades until a cheap Atari 600XL would turn up on eBay.de.

Maybe someone even knows a good source for replacement parts besides
buying a whole system at eBay?

Bye,
    Christian

A8 = Atari 800XL?

> Try holding down the OPTION silver key at power on, this will disable
> BASIC and maybe you'll see a blue screen.
Blue screen doesn't turn up: brown color and then black.

> Then there's purchasing a logic probe, which won't do you much good
> unless you have a working 600XL to compare with.
Hm, I never used a logic probe or an oszilloscope and I haven't got a
working 600XL to compare with, too. ^_^;
Next week I've got the chance to get an 800XL, but I guess that one
wouldn't help me, right?

> I guess this is a PAL 600XL, so things may be a little different from
> a NTSC one.
Yup, a PAL one.

> Finally, maybe get a 800XL, it is a more useful computer, the 16K
> 600XL can just about only run cartridges.
:-)
I wanted to get a 130XE first, but when I saw this "bargain"(?) for 12
Euro including an Atari 1010, four original games and six books about
programming at the fleamarket, I couldn't resist.
And I've got enough time to spend some hours trying to revive an old

computer from the dead...

Bye,
    Christian

A good source for parts for all Atari systems is Best Electronics.

Sorry, A8= 8-bit Atari, XLs, XEs, 400, 800, XEGS, all are 8-bits because they use 8-bit code, 16-bit address.

> > Try holding down the OPTION silver key at power on, this will disable

> Blue screen doesn't turn up: brown color and then black.
OK, probably not valid anyway (the BASIC chip may still be bad.)

> > Then there's purchasing a logic probe, which won't do you much good

> wouldn't help me, right?
NO!, a working 800XL would be very helpful. It is unlikely tho that the chips would be socketed, which apparently your 600XL is.
You really don't want to be desoldering un-socketed chips, but socketed ones, if carefully done, preferably with a IC puller, but could use a screwdriver.
Even if the chips aren't socketed, you might get an idea using a logic probe,
probably about 10 or 15 Euros. There are schematics that have the High, Low, Pulse for all the pins of the Large ICs (40 pins, and maybe the small ones too). The chips in the 800XL are the same for both, just in different places, you can tell what is what by the numbers on the chips.
eg. CO14806 for the CPU, probably CO12296 or CO21697 for Antic,
CO14805 for GTIA, CO12294 for Pokey, maybe CO60302 for
BASIC, CO61598 for OS, etc. I think I'm right here. Your PAL
Antic and GTIA are definitely going to be different, PAL Antic=CO21698
PAL GTIA=CO14889. (Looking up a bunch of IC codes....)
Of course, make sure the 800XL works. Sorry, I got lost.

>   Christian
Right, I hate to lose an Atari also, it is worth it to try to salvage one.
You could use your multimeter to check the main power lines (Vcc).
Probably just one of those large chips is bad, and I agree with
Kryten, the CPU would probably be the first to try to swap in.
Good Luck.

I usually do not post my eBay auctions but I though this one might be
interesting for some folks on the newsgroup. It is the 1050 Duplicator by
Duplicating Technologies. It was designed to be a hardware disk copying
solution but it sounds like it was more successful as a disk accelerator due
to its larger sector buffer. I have the original box, the add in board, two
revisions of the manual and two versions of the software. It does not
appear to have been used. I planned on using it to back up my 8-bit
software collection but now realize I will probably never get around to it.

Nick

First thing to do in non-blue XL/XE screen situation is to use that
multi-meter to verify that you have exactly 5 volts coming from the
power supply. Then check the voltage with the computer turned on, it
should still be exactly 5 volts. Best way to do that is with the cover
and RF shield off. Power supplies going bad are the most common thing
wrong.

Because of the above you then need to check for over-voltaged ram chip
damage by testing which one(s) are uncomfortably too hot to touch with
the computer turned on. 4416 is the base number for the 600XL ram
chips and you only have two (16K machine after all), mine say
TMS4416-15NL for example. You might try the same test on all the chips
if no ram chips are found to be very hot and your voltage is perfect.
B&C may have a 'pack' of 40 pin chips to use for substitution testing
or am I thinking of the long defunct Techno-vision? At any rate,
subbing out the big chips is your only real hope short of an EE degree
AND a scope if you get this far and haven't found a problem.

The good news is that the 600XL makes a good source of 40 pin parts for
the 64K 800XL and 130K 130XE? Look for B&C in the Vendors list in the
message titled 'Welcome to comp.sys.8bit' - That message is the group's
FAQ and will have current contact information for Atari vendors.

One other thing. I said check the main power places, I think called
the Vcc. One of these places would be where you would attach the
clip on a logic probe.
I think you could see the power sources in the schematics for the 600XL
(PAL, I'm pretty sure) at:

Note that all the diagrams are zipped PCX, and my PC doesn't handle that
image format. I can convert them into PNG (which uses less space than the
zipped PCX!) for anyone else who cannot read PCX.

I converted a few circuits for the kit I have:

Without an Atari connected the power supply has an output of 5.95V.
With an Atari connected to it, it goes down to 5.65V.

When checking the power supply, I saw that pin 6 had a loose contact
(sometimes 0V and sometimes 4.xV) and changed the plug. It didn't help.

> Because of the above you then need to check for over-voltaged ram chip

I checked the temperatures of all chips when the 600XL was turned on for
about 20 minutes. They ranged from "cold as room temperature" up to 41°C
(U2) but most are somewhere between 30°C and 35°C.

Bye,
    Christian

I'm pretty sure that I am outing myself as a newbie to this now... ;-)
Okay, err... what's a logic probe? I saw those things in a catalogue,
but I have got no clue what to measure with them and... hmm, what they
"do" or how to use them. :-)
...even the shopkeeper of the electronics shop in town (where I bought
my plug for the power supply) couldn't tell me what a logic probe is. ^_^;

Then... I read the schematics and checked the main power places (the
number on the line outside of the rectangle is the number of the leg,
right?).
I only got voltages of about 5V to about 7V between vcc and vss, except
for one IC: U15 (74LS375N) with less than 1V... somewhere around 0.3V.

Bye,
    Christian

And thanks for the hint that the 800XL has soldered ICs. :-)

Ahh, a logic probe is a pen like device that you connect to a 5V source with the wire that comes from it and it is a pen-like device that usually has a LED and a metal pointer that you touch a point on a pin or trace on the computer mother board. It will give an audible sound, one of three sounds, a low sound, a high sound or a pulsing sound for the low-high-pulse state of the point you're testing. In conjunction with a schematic that has the 'logic' H L P of points on it, you might be able to find a point that isn't right and figure out a problem. The Schematics that are at the site I mentioned don't have these 'notes' as to the logic of pins and points on the schematic. I have a 130XE schematic that does have these points. Actually, I'm not sure I ever accomplished anything with my logic probe. Except maybe by going back and forth between a working and non-working mother board.
ie. I guess the logic probe wouldn't help much.

Replacing the chips
is the most likely way to fix it. And I don't know if the 800XL in question has sockets or not, your seller probably doesn't know because you'd have to open it up and take the RF shield off to see the chips.
I think theres a fairly good chance the PAL 800XL has sockets, only because your 600XL has them. Maybe Andreas or one of the other Euro-A8ers could say.

> Then... I read the schematics and checked the main power places (the

> number on the line outside of the rectangle is the number of the leg,

I'm not sure what rectangle you're talking about, a big rectangle is
the chip, with pin numbers. I think most power ponts are a small circle
with +5 at them. Small rectangles are resistors with the numbers for
the Ohms. The +5v power points will have +5A or +5E, the letter
representing the source of the power, which you can see in one of
the schematics that has the power supply jack and on-off switch.

>
> And thanks for the hint that the 800XL has soldered ICs. :-)
It may or may not have sockets. But if you can verify that it works,
you'd have a working computer. The pins on the Large Scale Integrated
circuits, the 40 pin ICs should have just about the same logics on
the 600XL and 800XL.

Getting ahead of the game, the next thing you'll need is a SIO2PC
or APE cable to access the 1000s of programs available. Use
your PC with a serial cable as a disk drive.

Another thing you might need.
The numbers for the pins on the schematic goes like this.

```
    u
1       40
2       39
3        38
4        37
etc.
```

Looking down on the chip, with the 'u' meaning the notch, I think
the notch is always to the left as you look down on the mother board.
My example is a 40 pin chip, but smaller chips have the same idea.
Start at 1 go away from the notch, then up the other side of the chip.

Hmm, I think mine was 5.5V (10% high, erring on the safe side).

> I only got voltages of about 5V to about 7V between vcc and vss,

Are you sure your meter is okay?

If your PSU is driving 5V into the machine, you should not be seeing 7V
anywhere (assuming there is no step-up converter inside!).

Most computer logic chips expect VCC to be 5V +/- 5% or 10%.

So 7V sounds seriously unhealthy and I would not leave it switched on for
any length of time.

Swapping chips around would only destroy more chips...

> one IC: U15 (74LS375N) with less than 1V... somewhere around 0.3V.

That's definitely wrong.

Are you sure you got the right pins?
